1. FOURIER ANALYSIS ON \mathbb{R}^n

1.1. Schwartz Space.

Definition 1.1.1. Let $\alpha \in \mathbb{N}_0^n$ and $x, y \in \mathbb{R}^n$. We define

- (1) $\langle x, y \rangle = \sum_j x_j y_j$
- (2) $|x| = \langle x, x \rangle^{1/2}$
- (3) $|\alpha| = \alpha_1 + \cdots + \alpha_n$
- (4) $x^\alpha = x_1^{\alpha_1} \cdots x_n^{\alpha_n}$
- (5) $\partial^\alpha = \partial_{x_1}^{\alpha_1} \cdots \partial_{x_n}^{\alpha_n}$

Definition 1.1.2. Let $f \in C^\infty(\mathbb{R}^n)$, $\alpha \in \mathbb{N}_0^n$ and $N \in \mathbb{N}_0$. We define

$$\|f\|_{\alpha, N} = \sup_{x \in \mathbb{R}^n} (1 + |x|^N) |\partial^\alpha f(x)|$$

We define Schwartz space, denoted \mathcal{S} , by

$$\mathcal{S} = \{f \in C^\infty(\mathbb{R}^n) : \text{for each } \alpha \in \mathbb{N}_0^n, N \in \mathbb{N}_0, \|f\|_{\alpha, N} < \infty\}$$

Exercise 1.1.3. For each $f \in \mathcal{S}$ and $\alpha \in \mathbb{N}_0^n$, $\partial^\alpha f \in L^1(\mathbb{R}^n)$.

Proof. Let $f \in \mathcal{S}$, $\alpha \in \mathbb{N}_0^n$. Then there exists $C \geq 0$ such that for each $x \in \mathbb{R}^n$,

$$|\partial^\alpha f(x)| \leq C(1 + |x|^2)^{-1}$$

Define $g : \mathbb{R}^n \rightarrow [0, \infty)$ defined by $g(x) = (1 + |x|^2)^{-1}$. Then $g \in L^1(\mathbb{R}^n)$ which implies that $\partial^\alpha f \in L^1(\mathbb{R}^n)$. \square

Definition 1.1.4.

1.2. The Convolution.

Definition 1.2.1. Let $f, g \in L^0(\mathbb{R}^n)$. If for a.e. $x \in \mathbb{R}^n$,

$$\int_{\mathbb{R}^n} |f(x-y)g(y)|dm(y) < \infty$$

we define the **convolution of f with g** , denoted $f * g : \mathbb{R}^n \rightarrow \mathbb{C}$, by

$$f * g(x) = \int_{\mathbb{R}^n} f(x-y)g(y)dm(y)$$

Exercise 1.2.2. Let $f, g \in L^1(\mathbb{R}^n)$. Then $f * g \in L^1(\mathbb{R}^n)$ and $\|f * g\|_1 \leq \|f\|_1 \|g\|_1$.

Proof. Define $h \in L^0(\mathbb{R}^n \times \mathbb{R}^n)$ by $h(x, y) = f(x-y)g(y)$. Tonelli's theorem implies that,

$$\begin{aligned} \int_{\mathbb{R}^n \times \mathbb{R}^n} |h|dm^2 &= \int_{\mathbb{R}^n} \left[\int_{\mathbb{R}^n} |f(x-y)g(y)|dm(y) \right] dm(x) \\ &= \int_{\mathbb{R}^n} |g(y)| \left[\int_{\mathbb{R}^n} |f(x-y)|dm(y) \right] dm(x) \\ &= \|f\|_1 \int_{\mathbb{R}^n} |g(y)|dm(x) \\ &= \|f\|_1 \|g\|_1 \\ &< \infty \end{aligned}$$

Then $h \in L^1(\mathbb{R}^n \times \mathbb{R}^n)$. Fubini's theorem implies that $f * g \in L^1(\mathbb{R}^n)$. Clearly

$$\begin{aligned} \|f * g\|_1 &\leq \int_{\mathbb{R}^n \times \mathbb{R}^n} |h|dm^2 \\ &\leq \|f\|_1 \|g\|_1 \end{aligned}$$

□

Exercise 1.2.3. Let $f, g, h \in L^1(\mathbb{R}^n)$. Then $(f * g) * h = f * (g * h)$.

Hint: use the substitution $z \mapsto z - y$

Proof. Let $x \in \mathbb{R}^n$. Then using the substitution $z \mapsto z - y$ and Fubini's theorem, we obtain

$$\begin{aligned}
 (f * g) * h(x) &= \int f * g(x - y)h(y)dm(y) \\
 &= \int \left[\int f(x - y - z)g(z)dm(z) \right] h(y)dm(y) \\
 &= \int \left[\int f(x - z)g(z - y)dm(z) \right] h(y)dm(y) \\
 &= \int \left[\int f(x - z)g(z - y)h(y)dm(z) \right] dm(y) \\
 &= \int \left[\int f(x - z)g(z - y)h(y)dm(y) \right] dm(z) \\
 &= \int f(x - z) \left[\int g(z - y)h(y)dm(y) \right] dm(z) \\
 &= \int f(x - z)g * h(z)dm(z) \\
 &= f * (g * h)(x)
 \end{aligned}$$

So $(f * g) * h = f * (g * h)$. □

Exercise 1.2.4. Let $f, g \in L^1(\mathbb{R}^n)$. Then $f * g = g * f$.

Proof. Let $x \in \mathbb{R}^n$. Using the transformation $y \mapsto x - y$, we obtain that

$$\begin{aligned}
 f * g(x) &= \int f(x - y)g(y)dm(y) \\
 &= \int f(y)g(x - y)dm(y) \\
 &= \int g(x - y)f(y)dm(y) \\
 &= g * f(x)
 \end{aligned}$$

So $f * g = g * f$. □

Note 1.2.5. To summarize, $(L^1(\mathbb{R}^n), *)$ is a commutative Banach algebra.

Exercise 1.2.6. Young's Inequality:

Let $p \in [1, \infty]$, $f \in L^1$ and $g \in L^p$. Then $f * g \in L^p$ and $\|f * g\|_p \leq \|f\|_1 \|g\|_p$.

Proof. Define $K \in L^0(\mathbb{R}^n \times \mathbb{R}^n)$ by $K(x, y) = f(x - y)$. Since for each $x, y \in \mathbb{R}^n$,

$$\begin{aligned}
 \int |K(x, y)|dm(x) &= \int |K(x, y)|dm(y) \\
 &= \|f\|_p
 \end{aligned}$$

an exercise in section 5.1 of [4] implies that $f * g \in L^p$ and $\|f * g\|_p \leq \|f\|_1 \|g\|_p$. □

Exercise 1.2.7. Let $p, q \in [1, \infty]$ be conjugate, $f \in L^p(\mathbb{R}^n)$ and $g \in L^q(\mathbb{R}^n)$. Then

- (1) for each $x \in \mathbb{R}^n$, $f * g(x)$ exists.
- (2) $\|f * g\|_u \leq \|f\|_p \|g\|_q$

(3)

Proof. (1) Let $x \in \mathbb{R}^n$. Holder's inequality implies that

$$\int_{\mathbb{R}^n} |f(x-y)g(y)| dm(y) \leq \|f\|_p \|g\|_q$$

Then $f * g(x)$ exists.

(2) Let $x \in \mathbb{R}^n$. Then in part (1) we showed that

$$\begin{aligned} |f * g(x)| &= \left| \int_{\mathbb{R}^n} f(x-y)g(y) dm(y) \right| \\ &\leq \int_{\mathbb{R}^n} |f(x-y)g(y)| dm(y) \\ &\leq \|f\|_p \|g\|_q \end{aligned}$$

Since $x \in \mathbb{R}^n$ is arbitrary, $\|f * g\|_u \leq \|f\|_p \|g\|_q$.

(3)

□

Exercise 1.2.8. Let $f \in L^1(\mathbb{R}^n)$, $k \in \mathbb{N}$ and $g \in C^k(\mathbb{R}^n)$. Suppose that for each $\alpha \in \mathbb{N}_0^n$, $|\alpha| \leq k$ implies that $\partial^\alpha g \in L^\infty$. Then for each $\alpha \in \mathbb{N}_0^n$, $|\alpha| \leq k$ implies that $f * g \in C^k$ and

$$\partial^\alpha (f * g) = f * \partial^\alpha g$$

Proof. Let $\alpha \in \mathbb{N}_0^n$. Suppose that $|\alpha| = 1$. Define $h \in L^0(\mathbb{R}^n \times \mathbb{R}^n)$ by $h(x, y) = g(x-y)f(y)$. Young's inequality implies that for a.e. $x \in \mathbb{R}^n$, $h(x, \cdot) \in L^1(\mathbb{R}^n)$. For each $y \in \mathbb{R}^n$, $\partial^\alpha h(\cdot, y) = \partial^\alpha g(\cdot - y)f(y)$ and for each $x, y \in \mathbb{R}^n$, $|\partial^\alpha h(x, y)| \leq \|\partial^\alpha g\|_\infty |f(y)| \in L^1(\mathbb{R}^n)$. An exercise in section 3.3 of [4] implies that for a.e. $x \in \mathbb{R}^n$, $\partial^\alpha (g * f)(x)$ exists and

$$\begin{aligned} \partial^\alpha (f * g)(x) &= \partial^\alpha (g * f)(x) \\ &= \partial^\alpha \int_{\mathbb{R}^n} h(x, y) dm(y) \\ &= \int_{\mathbb{R}^n} \partial^\alpha g(x-y) f(y) dm(y) \\ &= (\partial^\alpha g) * f(x) \\ &= f * (\partial^\alpha g)(x) \end{aligned}$$

Now proceed by induction on $|\alpha|$.

□

1.3. The Fourier Transform.

Definition 1.3.1.

Exercise 1.3.2. Let $\phi : \mathbb{R} \rightarrow S^1$ be a measurable homomorphism.

- (1) Then $\phi \in L^1_{\text{loc}}(\mathbb{R})$ and there exists $a > 0$ such that

$$\int_{(0,a]} \phi dm \neq 0$$

- (2) Define

$$c = \left[\int_{(0,a]} \phi dm \right]^{-1}$$

Then For each $x \in \mathbb{R}$,

$$\phi(x) = c \int_{(x,x+a]} \phi dm$$

- (3) $\phi \in C^\infty(\mathbb{R})$ and $\phi' = c(\phi(a) - 1)\phi$
 (4) Define $b = c(\phi(a) - 1)$ and $g \in C^\infty(\mathbb{R})$ by $g(x) = e^{-bx}\phi(x)$. Then g is constant and there exists $\xi \in \mathbb{R}$ such that for each $x \in \mathbb{R}$, $\phi(x) = e^{2\pi i \xi x}$.

Proof.

- (1) Let $K \subset \mathbb{R}$ be compact. Then

$$\int_K |\phi| dm = m(K) < \infty$$

So $\phi \in L^1_{\text{loc}}(\mathbb{R})$. For the sake of contradiction, suppose that for each $a > 0$,

$$\int_{(0,a]} \phi dm = 0$$

Then the FTC implies that $\phi = 0$ a.e. on $[0, \infty)$, which is a contradiction. So there exists $a > 0$ such that

$$\int_{(0,a]} \phi dm \neq 0$$

- (2) For $x \in \mathbb{R}$,

$$\begin{aligned} \phi(x) &= c \int_{(0,a]} \phi(x)\phi(t) dm(t) \\ &= c \int_{(0,a]} \phi(x+t) dm(t) \\ &= c \int_{(x,x+a]} \phi dm \end{aligned}$$

- (3) Part (2) and the FTC imply that ϕ is continuous. Let $d \in \mathbb{R}$. Define $f_d \in C((d, \infty))$ by

$$f_d(x) = \int_{(d,x]} \phi dm$$

Since ϕ is continuous, the FTC implies that f_d is differentiable and for each $x > d$ $f'_d(x) = \phi(x)$. Part (2) implies that for each $x > d$,

$$\begin{aligned}\phi(x) &= c \int_{(x, x+a]} \phi dm \\ &= c(f_d(x+a) - f_d(x))\end{aligned}$$

So for each $x > d$, ϕ is differentiable at x and

$$\begin{aligned}\phi'(x) &= c(\phi(x+a) - \phi(x)) \\ &= c(\phi(a) - 1)\phi(x)\end{aligned}$$

Since $d \in \mathbb{R}$ is arbitrary, ϕ is differentiable and $\phi' = c(\phi(a) - 1)\phi$. This implies that $\phi \in C^\infty(\mathbb{R})$.

(4) Let $x \in \mathbb{R}$. Then

$$\begin{aligned}g'(x) &= e^{-bx}\phi'(x) - be^{-bx}\phi(x) \\ &= be^{-bx}\phi(x) - be^{-bx}\phi(x) \\ &= 0\end{aligned}$$

So $g' = 0$ and g is constant. Hence there exists $k \in \mathbb{R}$ such that for each $x \in \mathbb{R}$, $\phi(x) = ke^{bx}$. Since $\phi(0) = 1$, $k = 1$. Since $|\phi| = 1$, there exists $\xi \in \mathbb{R}$ such that $b = 2\pi i\xi$. □

Note 1.3.3. To summarize, for each measurable homomorphism $\phi : \mathbb{R} \rightarrow S^1$, there exists $\xi \in \mathbb{R}$ such that for each $x \in \mathbb{R}$, $\phi(x) = e^{2\pi i\xi x}$.

Exercise 1.3.4. Let $\phi : \mathbb{R}^n \rightarrow S^1$ be a measurable homomorphism. Then there $\xi \in \mathbb{R}^n$ such that for each $x \in \mathbb{R}^n$, $\phi(x) = e^{2\pi i\langle \xi, x \rangle}$.

Proof. When done in the category of measurable groups, an exercise in the section on direct products of groups of [3] implies that there exist measurable homomorphism $(\phi_j)_{j=1}^n \subset (S^1)^\mathbb{R}$ such that $\phi = \bigotimes_{j=1}^n \phi_j$. The previous exercise implies that there exist $\xi \in \mathbb{R}^n$ such that for each $x \in \mathbb{R}^n$, $\phi_j(x_j) = e^{2\pi i\xi_j x_j}$. Then for each $x \in \mathbb{R}^n$,

$$\begin{aligned}\phi(x) &= \prod_{j=1}^n \phi_j(x_j) \\ &= \prod_{j=1}^n e^{2\pi i\xi_j x_j} \\ &= e^{2\pi i \sum_{j=1}^n \xi_j x_j} \\ &= e^{2\pi i\langle \xi, x \rangle}\end{aligned}$$

□

Definition 1.3.5. Let $f \in L^1(\mathbb{R}^n)$. We define the **Fourier transform of f** , denoted $\hat{f} : \mathbb{R}^n \rightarrow \mathbb{C}$ by

$$\hat{f}(\xi) = \frac{1}{(2\pi)^{n/2}} \int_{\mathbb{R}^n} f(x) e^{-2\pi i\langle \xi, x \rangle} dm(x)$$

2. FOURIER ANALYSIS ON LCA GROUPS

2.1. The Convolution.

Note 2.1.1. For the remainder of the section, we fix a locally compact abelian group G and a Haar measure μ on G .

Definition 2.1.2. Let $f, g \in L^1(\mu)$. We define the **convolution of f with g** , denoted $f * g : G \rightarrow \mathbb{C}$, by

$$f * g(x) = \int_X f(x - y)g(y)d\mu(y)$$

Exercise 2.1.3. Let $f, g \in L^1(\mu)$. Then $f * g \in L^1(\mu)$.

Proof. By Tonelli's theorem,

$$\begin{aligned} \int_X |f * g|d\mu &\leq \int_X \left[\int_X |f(x - y)g(y)|d\mu(y) \right] d\mu(x) \\ &= \int_X |g(y)| \left[\int_X |f(x - y)|d\mu(y) \right] d\mu(x) \\ &= \|f\|_1 \int_X |g(y)|d\mu(x) \\ &= \|f\|_1 \|g\|_1 \\ &< \infty \end{aligned}$$
