### Chapter 1

## **Prelimiaries**

#### 1.1 Category Theory

- Hilb:
  - $\operatorname{Obj}(\mathbf{Hilb}) := \{ H : H \text{ is a Hilbert space} \}$
  - $\operatorname{Hom}_{\mathbf{Hilb}}(H_1, H_2) := \operatorname{Hom}_{\mathbf{Ban}}(H_1, H_2)$
- Mon

#### 1.1.1 The Unitary Group

**Definition 1.1.1.1.** Let  $H_1, H_2 \in \text{Obj}(\mathbf{Hilb})$ . We define the unitary group from  $H_1$  to  $H_2$ , denoted  $U(H_1, H_2)$ , by

$$U(H_1, H_2) = \{ T \in \text{Iso}_{\mathbf{Hilb}}(H_1, H_2) : T^* = T^{-1} \}$$

We write U(H) in place of U(H,H). We equip  $U(H_1,H_2)$  with the strong operator topology.

**Exercise 1.1.1.2.** Let  $H \in \text{Obj}(\mathbf{Hilb})$ . Then  $\mathcal{T}^s_{U(H)} = \mathcal{T}^w_{U(H)}$ . strong weak operator topologies coincide

**Exercise 1.1.1.3.** Let  $H \in \text{Obj}(\mathbf{Hilb})$ . Then U(H) is a topological group.

Proof. content...

### Chapter 2

## Representation Theory

#### 2.1 Group Representations

#### 2.1.1 Unitary representations

**Definition 2.1.1.1.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $H \in \text{Obj}(\mathbf{Hilb})$  and  $\pi \in \text{Hom}_{\mathbf{TopGrp}}(G, U(H))$ . Then  $(H, \pi)$  is said to be a unitary representation of G. We define the **dimension of**  $(H, \pi)$ , denoted  $\dim(H, \pi)$ , by  $\dim(H, \pi) := \dim V$ .

**Definition 2.1.1.2.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $(H_{\pi}, \pi)$ ,  $(H_{\rho}, \rho)$  unitary representations of G and  $T \in \text{Hom}_{\mathbf{Hilb}}(H_{\pi}, H_{\rho})$ . Then T is said to be  $(\pi, \rho)$ -equivariant if for each  $g \in G$ ,  $T \circ \pi(g) = \rho(g) \circ T$ , i.e. the following diagram commutes:

$$\begin{array}{ccc} H_{\pi} & \stackrel{T}{\longrightarrow} & H_{\rho} \\ \pi(g) \!\!\! \downarrow & & \!\!\! \downarrow \!\!\! \rho(g) \\ H_{\pi} & \stackrel{T}{\longrightarrow} & H_{\rho} \end{array}$$

**Definition 2.1.1.3.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ . We define  $\mathbf{URep}(G)$  by

- Obj(URep(G)) =  $\{(H, \pi) : (H, \pi) \text{ is a unitary representation of } G\}$ .
- for  $(H_{\pi}, \pi), (H_{\rho}, \rho) \in \text{Obj}(\mathbf{URep}(G)),$

$$\operatorname{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho)) = \{T \in \operatorname{Hom}_{\mathbf{Hilb}}(H_{\pi}, H_{\rho}) : T \text{ is } (\pi, \rho) \text{-equivariant} \}$$

• for  $(H_{\pi}, \pi)$ ,  $(H_{\rho}, \rho)$ ,  $(H_{\mu}, \mu) \in \text{Obj}(\mathbf{URep}(G))$ ,  $T \in \text{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho))$  and  $S \in \text{Hom}_{\mathbf{URep}(G)}((H_{\rho}, \rho), (H_{\mu}, \mu))$ ,

$$S \circ_{\mathbf{URep}(G)} T = S \circ T$$

**Exercise 2.1.1.4.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ . Then  $\mathbf{URep}(G)$  is a category.

Proof. FINISH!!!

Exercise 2.1.1.5. Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H_{\pi}, \pi), (H_{\rho}, \rho) \in \text{Obj}(\mathbf{URep}(G))$ . Then  $\text{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho)) \in \text{Obj}(\mathbf{Vect}_{\mathbb{C}})$ .

*Proof.* Let  $S, T \in \text{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho))$  and  $\lambda \in \mathbb{C}$ . Then for each  $g \in G$ ,

$$(S + \lambda T) \circ \pi(g) = S \circ \pi(g) + \lambda T \circ \pi(g)$$
  
=  $\rho(g) \circ S + \rho(g) \circ (\lambda T)$   
=  $\rho(g) \circ (S + \lambda T)$ .

Hence  $S + \lambda T \in \operatorname{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho))$ . Since  $S, T \in \operatorname{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho))$  and  $\lambda \in \mathbb{C}$  is arbitrary, we have that  $\operatorname{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho)) \in \operatorname{Obj}(\mathbf{Vect}_{\mathbb{C}})$ .

**Definition 2.1.1.6.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H_{\pi}, \pi), (H_{\rho}, \rho) \in \mathbf{URep}(G)$ . Then  $(H_{\pi}, \pi)$  is said to be **unitarily equivalent** to  $(H_{\rho}, \rho)$ , denoted  $(H_{\pi}, \pi) \equiv (H_{\rho}, \rho)$ , if  $\mathrm{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho)) \cap U(H_{\pi}, H_{\rho}) \neq \emptyset$ .

Note 2.1.1.7. Let  $\pi \in \text{Hom}_{\textbf{TopGrp}}(G, U(H))$ . Since U(H) is equipped with the strong operator topology, we have that for each  $u \in H$ , the map  $g \mapsto \pi(g)u$  is continuous.

**Definition 2.1.1.8.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ . We define the **induced group action of** G **on** H, denoted  $\phi_{(H,\pi)} : G \times H \to H$ , by

$$\phi_{(H,\pi)}(g,v) = \pi(g)v$$

**Note 2.1.1.9.** When the context is clear, we write  $g \cdot v$  in place of  $\phi_{(H,\pi)}(g,v)$ .

**Exercise 2.1.1.10.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ . Then

- 1.  $\phi_{(H,\pi)}$  is a linear group action.
- 2. G is locally compact implies that  $\phi_{(H,\pi)}$  is continuous

Proof.

- 1. Let  $g, h \in G$  and  $v \in H$ .
  - (a) Since  $\pi \in \text{Hom}_{\mathbf{TopGrp}}(G, U(H))$ ,

$$e \cdot v = \pi(e)v$$
$$= id_H v$$
$$= v$$

(b) Since  $\pi \in \text{Hom}_{\mathbf{TopGrp}}(G, U(H))$ ,

$$g \cdot (h \cdot v) = \pi(g)[\pi(h)v]$$
$$= [\pi(g)\pi(h)]v$$
$$= \pi(gh)v$$
$$= (gh) \cdot v$$

Since  $g, h \in G$  and  $v \in H$  are arbitrary,  $\phi_{(H,\pi)}$  is a group action of G on H.

• Let  $g \in G$ ,  $\lambda \in \mathbb{C}$  and  $v, w \in H$ . Then

$$g \cdot (\lambda v + w)$$

$$= \pi(g)(\lambda v + w)$$

$$= \lambda \pi(g)v + \pi(g)w$$

$$= \lambda g \cdot v + g \cdot w$$

Since  $g \in G$ ,  $\lambda \in \mathbb{C}$  and  $v, w \in H$  are arbitrary,  $\phi_{(H,\pi)}$  is a linear action.

2. Suppose that G is locally compact. Let  $(g_0, v_0) \in G \times H$  and  $\epsilon > 0$ . Since G is locally compact, there exists  $K \subset G$  such that  $g_0 \in \text{Int } K$  and K is compact. Let  $v \in H$ . Define  $f_v : G \to H$  by  $f_v(g) = g \cdot v$ . Since  $\pi : G \to U(H)$  is continuous,  $f_v$  is continuous. Thus  $||f_v||$  is continuous. Since K is compact,  $||f_v||(K)$  is compact. Thus

$$\sup_{g \in K} \|g \cdot v\| = \sup_{g \in K} \|f_v(g)\|$$

Since  $v \in H$  is arbitrary, we have that for each  $v \in H$ ,  $\sup_{g \in K} \|g \cdot v\| < \infty$ . The uniform boundedness principle implies that there exists M > 0 such that  $\sup_{g \in K} \|\pi(g)\| \le M$ . Since  $f_{v_0}$  is continuous, there exists  $U \subset K$  such that U is open,

 $g_0 \in U$ , and  $f_{v_0}(U) \subset B(f_{v_0}(g_0), \epsilon/2)$ . Let  $(g_1, v_1) \in U \times B(v_0, (2M)^{-1}\epsilon)$ . Then

$$\|\phi_{(H,\pi)}(g_0, v_0) - \phi_{(H,\pi)}(g_1, v_1)\| = \|g_0 \cdot v_0 - g_1 \cdot v_1\|$$

$$\leq \|g_0 \cdot v_0 - g_1 \cdot v_0\| + \|g_1 \cdot v_0 - g_1 \cdot v_1\|$$

$$= \|f_{v_0}(g_0) - f_{v_0}(g_1)\| + \|\pi(g_1)(v_0 - v_1)\|$$

$$\leq \|f_{v_0}(g_0) - f_{v_0}(g_1)\| + \|\pi(g_1)\|\|v_0 - v_1\|$$

$$\leq \|f_{v_0}(g_0) - f_{v_0}(g_1)\| + M\|v_0 - v_1\|$$

$$\leq \frac{\epsilon}{2} + M \frac{\epsilon}{2M}$$

$$= \epsilon$$

Since  $\epsilon > 0$  is arbitrary, we have that  $\phi_{(H,\pi)}$  is continuous at  $(g_0, v_0)$ . Since  $(g_0, v_0) \in G \times H$  is arbitrary, we have that  $\phi_{(H,\pi)} : G \times H \to H$  is continuous.

#### 2.1.2 Subrepresentations

**Definition 2.1.2.1.** Let  $G \in \text{Obj}(\mathbf{TopGrp}), (H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $E \subset H$  a closed subspace. Then E is said to be

- nontrivial if  $E \neq H, \emptyset$
- $(H,\pi)$ -invariant if for each  $g \in G$ ,  $\pi(g)(E) \subset E$

**Exercise 2.1.2.2.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $E \subset H$  a closed subspace. Suppose that E is  $(H, \pi)$ -invariant. Then for each  $g, h \in G$ ,

- 1.  $\pi(g)|_E \in \text{Aut}_{\mathbf{Hilb}}(E), \ \pi(g)|_E^{-1} = \pi(g^{-1})|_E \ \text{and} \ \pi(g)(E) = E,$
- 2.  $\pi(g)|_E \in U(E)$  and  $\pi(g)|_E^* = \pi(g^{-1})|_E$ ,
- 3.  $\pi(gh)|_E = \pi(g)|_E \circ \pi(h)|_E$ .

Proof. Let  $g, h \in G$ .

1. Let  $x \in E$ . Since E is  $(H, \pi)$ -invariant, we have that  $\pi(g)(x) \in E$ . Therefore

$$\begin{split} [\pi(g^{-1})|_E \circ \pi(g)|_E](x) &= \pi(g^{-1})|_E[\pi(g)|_E(x)] \\ &= \pi(g^{-1})|_E[\pi(g)(x)] \\ &= \pi(g^{-1})[\pi(g)(x)] \\ &= [\pi(g^{-1}) \circ \pi(g)](x) \\ &= \pi(g^{-1}g)(x) \\ &= \pi(e)(x) \\ &= I(x) \\ &= I_E(x). \end{split}$$

Similarly,  $\pi(g^{-1})(x) \in E$  and  $[\pi(g)|_E \circ \pi(g^{-1})|_E](x) = I|_E(x)$ . Since  $x \in E$  is arbitrary, we have that  $\pi(g)|_E \in \operatorname{Aut}_{\mathbf{Hilb}}(E)$  and  $\pi(g^{-1})|_E = \pi(g)|_E^{-1}$ . Since  $\pi(g)|_E \in \operatorname{Aut}_{\mathbf{Hilb}}(E)$ , we have that

$$\pi(g)(E) = \pi(g)|_{E}(E)$$
$$= E.$$

2. Let  $x, y \in E$ . Then

$$\langle \pi(g)|_E x, y \rangle = \langle \pi(g)x, y \rangle$$
$$= \langle x, \pi(g)^* y \rangle$$
$$= \langle x, \pi(g)^*|_E y \rangle$$

Since  $x, y \in E$  are arbitrary, we have that  $\pi(g)|_E^* = \pi(g)^*|_E$ . The previous part then implies that

$$\pi(g)|_{E}^{*} = \pi(g)^{*}|_{E}$$

$$= \pi(g)^{-1}|_{E}$$

$$= \pi(g^{-1})|_{E}$$

$$= \pi(g)|_{E}^{-1}.$$

Since  $\pi(g)|_E^* = \pi(g)|_E^{-1}$ , we have that  $\pi(g)|_E \in U(E)$ .

3. Let  $x \in E$ . Since E is  $(H, \pi)$ -invariant, we have that  $\pi(h)(x) \in E$  and therefore

$$\begin{aligned} \pi(gh)|_{E}(x) &= \pi(gh)(x) \\ &= [\pi(g) \circ \pi(g)](x) \\ &= \pi(g)[\pi(h)(x)] \\ &= \pi(g)|_{E}[\pi(h)(x)] \\ &= \pi(g)|_{E}[\pi(h)|_{E}(x)] \\ &= [\pi(g)|_{E} \circ \pi(g)|_{E}](x). \end{aligned}$$

Since  $x \in E$  is arbitrary, we have that  $\pi(gh)|_E = \pi(g)|_E \circ \pi(g)|_E$ .

**Definition 2.1.2.3.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $\mathbb{K} \in \text{Obj}(\mathbf{Field})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ . Then

•  $(H,\pi)$  is said to be **reducible** if there exists a closed subspace  $E \subset H$  such that E is not trivial and E is  $(H,\pi)$ -invariant

•  $(H,\pi)$  is said to be **irreducible** if  $(H,\pi)$  is not reducible.

**Definition 2.1.2.4.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $E \subset H$  a closed subspace. Suppose that E is  $(H, \pi)$ -invariant.

- We define  $\pi^E \in \operatorname{Hom}_{\mathbf{TopGrp}}(G, U(E))$  by  $\pi^E(g) := \pi(g)|_E$
- We define the **restriction**  $(H,\pi)$  **to** E, denoted  $(H,\pi)|_E$ , by  $(H,\pi)|_E := (E,\pi^E)$

**Exercise 2.1.2.5.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $E \subset H$  a closed subspace.

- 1. If E is nontrivial, then  $E^{\perp}$  is nontrivial.
- 2. If E is  $(H, \pi)$ -invariant, then  $E^{\perp}$  is  $(H, \pi)$ -invariant.

Proof.

- 1. Suppose that E is nontrivial. Then  $E \neq \{0\}, H$ . Then  $E^{\perp} \neq \{0\}, H$ . Thus  $E^{\perp}$  is nontrivial.
- 2. Suppose that E is  $(H, \pi)$ -invariant. Let  $g \in G$ . Since  $\pi(g) \in U(H)$  and  $\pi(g)(E) = E$ , An exercise in the analysis notes section on Hilbert spaces implies that  $\pi(g)(E^{\perp}) = E^{\perp}$ . Since  $g \in G$  is arbitrary,  $E^{\perp}$  is  $(H, \pi)$ -invariant.

**Definition 2.1.2.6.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $u \in H$ . We define the **cyclic subspace of** H **generated by** u **under**  $(H, \pi)$ , denoted  $\text{cyc}_{(H, \pi)}(u)$ , by

$$\operatorname{cyc}_{(H,\pi)}(u) := \operatorname{cl}\operatorname{span}(\phi_{(H,\pi)}(G,u))$$

replace  $\phi(G, u)$  with  $G \triangleright u$ 

Note 2.1.2.7. When the context is clear, we write  $\operatorname{cyc}(u)$  in place of  $\operatorname{cyc}_{(H,\pi)}(u)$ .

**Exercise 2.1.2.8.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $u \in H$ . Then cyc(u) is  $(H, \pi)$ -invariant. this should largely be a result about linear group actions.

*Proof.* Let  $g \in G$ . Since G acts linearly and homeomorphically on H,

$$g \cdot \operatorname{cyc}(u) = g \cdot \operatorname{cl} \operatorname{span}(G \cdot u)$$

$$= \operatorname{cl} g \cdot \operatorname{span}(G \cdot u)$$

$$= \operatorname{cl} \operatorname{span}[g \cdot (G \cdot u)]$$

$$= \operatorname{cl} \operatorname{span}(G \cdot u)$$

$$= \operatorname{cyc}(u)$$

Since  $g \in G$  is arbitrary, cyc(u) is G-invariant.

**Definition 2.1.2.9.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ .

- Let  $u \in H$ . Then u is said to be  $(H, \pi)$ -cyclic if  $\operatorname{cyc}(u) = H$ .
- Then  $(H,\pi)$  is said to be **cyclic** if there exists  $u \in H$  such that u is  $(H,\pi)$ -cyclic.

#### 2.1.3 Direct Sum of Representations

**Definition 2.1.3.1.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H_{\alpha}, \pi_{\alpha})_{\alpha \in A} \subset \text{Obj}(\mathbf{URep}(G))$ .

• We define  $\bigoplus_{\alpha \in A} \pi_{\alpha} \in \operatorname{Hom}_{\mathbf{TopGrp}}(G, U(\bigoplus_{\alpha \in A} H_{\alpha}))$  by

$$\left[\bigoplus_{\alpha\in A}\pi_{\alpha}\right](g) = \bigoplus_{\alpha\in A}\pi_{\alpha}(g)$$

• We define the **direct sum** of  $(H_{\alpha}, \pi_{\alpha})_{\alpha \in A}$ , denoted  $\bigoplus_{\alpha \in A} (H_{\alpha}, \pi_{\alpha})$ , by

$$\bigoplus_{\alpha \in A} (H_{\alpha}, \pi_{\alpha}) = \left(\bigoplus_{\alpha \in A} H_{\alpha}, \bigoplus_{\alpha \in A} \pi_{\alpha}\right)$$

Note 2.1.3.2. FINISH!!! the last definition works for internal or external direct sum, just need to define inner or external sum of  $H_{\alpha}$  and  $\pi_{\alpha}$  in either case, work out problems of unitary operators in analysis notes, eg, direct product of unitary operators in unitary, internal direct products, etc

**Exercise 2.1.3.3.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $E \subset H$  a closed subspace. If E is  $(H, \pi)$ -invariant, then  $(H, \pi) = (E \oplus E^{\perp}, \pi^E \oplus \pi^{E^{\perp}})$ .

*Proof.* Suppose that E is  $(H, \pi)$ -invariant. A previous exercise implies that  $E^{\perp}$  is  $(H, \pi)$ -invariant. Since  $H = E \oplus E^{\perp}$ . Let  $g \in G$  and  $u \in H$ . Since  $H = E \oplus E^{\perp}$ , there exists  $v \in E$  and  $w \in E^{\perp}$  such that u = v + w. Then

$$\begin{split} \pi(g)(u) &= \pi(g)(v+w) \\ &= \pi(g)(v) + \pi(g)(w) \\ &= \pi(g)|_{E}(v) + \pi(g)|_{E^{\perp}}(w) \\ &= \pi^{E}(g)(v) + \pi^{E^{\perp}}(g)(w) \\ &= [\pi^{E}(g) \oplus \pi^{E^{\perp}}(g)](v+w) \\ &= [\pi^{E} \oplus \pi^{E^{\perp}}](g)(v+w) \\ &= [\pi^{E} \oplus \pi^{E^{\perp}}](g)(u) \end{split}$$

Since  $u \in H$  is arbitrary,  $\pi(g) = [\pi^E \oplus \pi^{E^{\perp}}](g)$ . Since  $g \in G$  is arbitrary,  $\pi = \pi^E \oplus \pi^{E^{\perp}}$ .

**Definition 2.1.3.4.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ ,  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $\mathcal{E} \subset \mathcal{P}(H)$ . Then  $\mathcal{E}$  is said to be an  $(H, \pi)$ orthocyclic system if for each  $E, F \in \mathcal{E}$ ,

- 1. E is a closed subspace of H
- 2.  $(H,\pi)|_E$  is cyclic
- 3. if  $E \neq F$ , then  $E \perp F$

**Exercise 2.1.3.5.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ . Then there exists  $\mathcal{E} \subset \mathcal{P}(H)$  such that  $\mathcal{E}$  is an  $(H, \pi)$ -orthocyclic system and  $(H, \pi) = \bigoplus_{E \in \mathcal{E}} (H, \pi)|_E$ .

Hint: Zorn's lemma

Proof. Define  $\mathcal{P} = \{\mathcal{E} : \mathcal{E} \text{ is an } (H, \pi)\text{-orthocyclic system}\}$ . We partially order  $\mathcal{P}$  by inclusion. Let  $\mathcal{C} \subset \mathcal{P}$  be a chain. Set  $\mathcal{E}_0 = \bigcup_{\mathcal{E} \in \mathcal{C}} \mathcal{E}$ . Let  $E_1, E_2 \in \mathcal{E}_0$ . Then there exist  $\mathcal{E}_1, \mathcal{E}_2 \in \mathcal{C}$  such that  $E_1 \in \mathcal{E}_1$  and  $E_2 \in \mathcal{E}_2$ . Since  $\mathcal{C}$  is a chain,  $\mathcal{E}_1 \subset \mathcal{E}_2$  or  $\mathcal{E}_2 \subset \mathcal{E}_1$ . Suppose that  $\mathcal{E}_1 \subset \mathcal{E}_2$ . Then  $E_1 \in \mathcal{E}_2$ . Since  $\mathcal{E}_2$  is an  $(H, \pi)$ -orthocyclic system, we have that  $E_1$  is a closed subspaces of H,  $(H, \pi)|_{E_1}$  is cyclic and if  $E_1 \neq E_2$ , then  $E_1 \perp E_2$ . Similarly,  $\mathcal{E}_2 \subset \mathcal{E}_1$  implies the same conclusion. Since  $E_1, E_2 \in \mathcal{E}_0$  are arbitrary, we have that for each  $E_1, E_2 \in \mathcal{E}_0$ 

- 1.  $E_1$  is a closed subspaces of H and  $E_1$  is  $(H, \pi)$ -invariant
- 2.  $(H,\pi)|_{E_1}$  is cyclic
- 3. if  $E_1 \neq E_2$ , then  $E_1 \perp E_2$

Thus  $\mathcal{E}_0$  is an  $(H,\pi)$ -orthocyclic system. Hence  $\mathcal{E}_0 \in \mathcal{P}$ . By construction, for each  $\mathcal{E} \in \mathcal{C}$ ,  $\mathcal{E} \subset \mathcal{E}_0$ . So  $\mathcal{E}_0$  is an upper bound of  $\mathcal{C}$ . Since  $\mathcal{C} \subset \mathcal{P}$  such that  $\mathcal{C}$  is a chain is arbitrary, we have that for each  $\mathcal{C} \subset \mathcal{P}$ , if  $\mathcal{C}$  is a chain, then there exists  $\mathcal{E}_0 \in \mathcal{P}$  such that  $\mathcal{E}_0$  is an upper bound of  $\mathcal{C}$ . Zorn's lemma implies that there exists  $\mathcal{E} \in \mathcal{P}$  such that  $\mathcal{E}$  is maximal. Set  $E = \bigoplus_{\mathcal{E}_0 \in \mathcal{E}} \mathcal{E}_0$ .

For the sake of contradiction, suppose that  $H \neq E$ . Then  $E^{\perp} \neq \{0\}$ . Thus there exists  $u \in E^{\perp}$  such that  $u \neq 0$ . Therefore  $\operatorname{cyc}(u) \neq 0$  and  $\operatorname{cyc}(u) \subset E^{\perp}$ . Let  $E_0 \in \mathcal{E}$ . By construction,  $E_0 \subset E$ . Thus

$$\operatorname{cyc}(u) \subset E^{\perp}$$
  
 $\subset E_0^{\perp}$ 

Since  $E_0 \in \mathcal{E}$  is arbitrary, we have that for each  $E_0 \in \mathcal{E}$ ,  $\operatorname{cyc}(u) \subset E_0^{\perp}$ . Set  $\mathcal{E}' = \mathcal{E} \cup \{\operatorname{cyc}(u)\}$ . Then for each  $E, F \in \mathcal{E}'$ ,

- 1. E is a closed subspaces of H and E is  $(H, \pi)$ -invariant
- 2.  $(H,\pi)|_E$  is cyclic
- 3. if  $E \neq F$ , then  $E \perp F$

Hence  $\mathcal{E}' \in \mathcal{P}$ . Since  $\mathcal{E} \subset \mathcal{E}'$  and  $\mathcal{E}$ 

Note 2.1.3.6. Let H be a Hilbert space and  $E \subset H$  a closed subspace. We denote the orthogonal projection onto E by  $P_E$ .

**Exercise 2.1.3.7.** Let  $G \in \text{Obj}(\mathbf{TopGrp}), (H, \pi) \in \text{Obj}(\mathbf{URep}(G))$  and  $E \subset H$  a closed subspace. Then E is  $(H, \pi)$ -invariant iff  $P_E \in \text{End}_{\mathbf{URep}(G)}((H, \pi))$ .

Proof.

•  $(\Longrightarrow)$ :

Suppose that E is  $(H, \pi)$ -invariant. Let  $g \in G$  and  $z \in H$ . Then there exists  $x \in E$  and  $y \in E^{\perp}$  such that z = x + y. Since E is  $(H, \pi)$  invariant,  $\pi(g)(x) \in E$ . Thus

$$\pi(g) \circ P_E(x) = \pi(g)(x)$$
$$= P_E \circ \pi(g)(x).$$

Since E is  $(H, \pi)$ -invariant, ref previous ex here implies that  $E^{\perp}$  is  $(H, \pi)$ -invariant. Therefore  $\pi(g)(y) \in E^{\perp}$  and

$$\pi(g) \circ P_E(x) = \pi(g)(0)$$

$$= 0$$

$$= P_E \circ \pi(g)(y).$$

Hence

$$\pi(g) \circ P_{E}(z) = \pi(g) \circ P_{E}(x+y)$$

$$= \pi(g) \circ P_{E}(x) + \pi(g) \circ P_{E}(y)$$

$$= P_{E} \circ \pi(g)(x) + P_{E} \circ \pi(g)(y)$$

$$= P_{E} \circ \pi(g)(x+y)$$

$$= P_{E} \circ \pi(g)(z).$$

Since  $z \in H$  is arbitrary, we have that  $\pi(g) \circ P_E = P_E \circ \pi(g)$ . Since  $g \in G$  is arbitrary,  $P_E \in \operatorname{End}_{\mathbf{URep}(G)}(H, \pi)$ .

• (**⇐** ):

Conversely, suppose that  $P_E \in \text{End}_{\mathbf{URep}(G)}((H,\pi))$ . Let  $g \in G$  and  $x \in E$ . Then

$$\pi(g)(x)$$

$$= \pi(g) \circ P_E(x)$$

$$= P_E \circ \pi(g)(x)$$

$$\in E.$$

Since  $x \in E$  is arbitrary,  $\pi(g)(E) \subset E$ . Since  $g \in G$  is arbitrary, E is  $(H, \pi)$ -invariant.

#### 2.2 Tannaka Duality

**Definition 2.2.0.1.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$ . We define the **forgetful functor from URep**(G) **to Hilb**, denoted  $U : \mathbf{URep}(G) \to \mathbf{Hilb}$ , by

- $U(H,\pi) = H$ ,  $(H,\pi) \in \text{Obj}(\mathbf{URep}(G))$
- U(T) = T,  $T \in \operatorname{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho))$ .

Need to find out if quotienting by equivalence of isomorphism makes  $\mathbf{URep}(G)$  a small category so that we can talk about the functor category  $\mathbf{Hilb}^{\mathbf{URep}(G)}$  containing the forgetful functor as an object.

**Definition 2.2.0.2.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $g \in G$ . We define  $\hat{g}: U \Rightarrow U$  by

$$\hat{g}_{(H,\pi)} = \pi(g)$$

**Exercise 2.2.0.3.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $g \in G$ . Then

- 1.  $\hat{g}: U \Rightarrow U$  is a natural transformation.
- 2.  $\hat{g} \in \operatorname{Aut}_{\mathbf{Hilb}^{\mathbf{URep}(G)}}(U)$

Proof.

1. (a) Let  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ . By definition,

$$\hat{g}_{(H,\pi)} = \pi(g)$$

$$\in U(H)$$

$$\subset \operatorname{Aut}_{\mathbf{Hilb}}(U(H,\pi))$$

(b) Let  $(H_{\pi}, \pi)$ ,  $(H_{\rho}, \rho) \in \text{Obj}(\mathbf{URep}(G))$  and  $T \in \text{Hom}_{\mathbf{URep}(G)}((H_{\pi}, \pi), (H_{\rho}, \rho))$ . By definition,  $T \in \text{Hom}_{\mathbf{Hilb}}(H_{\pi}, H_{\rho})$  and T is  $(\pi, \rho)$ -equivariant. Therefore

$$U(T) \circ \hat{g}_{(H_{\pi},\pi)} = T \circ \pi(g)$$

$$= \rho(g) \circ T$$

$$= \hat{g}_{(H_{\rho},\rho)} \circ U(T)$$

i.e. the following diagram commutes:

$$U(H_{\pi}, \pi) \xrightarrow{\hat{g}_{(H_{\pi}, \pi)}} U(H_{\pi}, \pi) \qquad H_{\pi} \xrightarrow{\pi(g)} H_{\pi}$$

$$U(T) \downarrow \qquad \qquad \downarrow U(T) \qquad = \qquad \downarrow T \qquad \qquad \downarrow T$$

$$U(H_{\rho}, \rho) \xrightarrow{\hat{g}_{(H_{\rho}, \rho)}} U(H_{\rho}, \rho) \qquad H_{\rho} \xrightarrow{\rho(g)} H_{\rho}$$

Thus  $\hat{g}: U \Rightarrow U$  is a natural transformation.

2. Set  $h = g^{-1}$ . Part (1) implies that  $\hat{g}, \hat{h} \in \operatorname{End}_{\mathbf{Hilb}U\mathbf{Rep}(G)}(U)$ . Let  $(H, \pi) \in \operatorname{Obj}(\mathbf{URep}(G))$ . Then

$$(\hat{g} \circ \hat{h})_{(H,\pi)} = \hat{g}_{(H,\pi)}$$

The previous part implies that

$$\begin{split} \hat{g} &\in \mathrm{Hom}_{\mathbf{TopVect}^{\mathbf{URep}(G)}_{\mathbb{C}}}(U, U) \\ &= \mathrm{End}_{\mathbf{TopVect}^{\mathbf{URep}(G)}_{\mathbb{C}}}(U) \end{split}$$

2.2. TANNAKA DUALITY

**Definition 2.2.0.4.** Let  $G \in \text{Obj}(\mathbf{TopGrp})$  and  $(H, \pi) \in \text{Obj}(\mathbf{URep}(G))$ . We define the  $(H, \pi)$ -projection, denoted  $\pi_{(H,\pi)} : \text{End}_{\mathbf{TopVect}_{\mathbb{C}}^{\mathbf{URep}(G)}}(U) \to \text{End}_{\mathbf{TopVect}_{\mathbb{C}}}(V)$ , by  $\pi_{(H,\pi)}(\alpha) = \alpha_{(H,\pi)}$ . We define the **topology of endomorphisms of** U, denoted  $\mathcal{T}_{\mathcal{E}(U)}$ , by

 $\mathcal{T}_{\mathcal{E}(U)} = \tau(\pi_{(H,\pi)}: (H,\pi) \in \mathbf{URep}(G))$ 

**Definition 2.2.0.5.** define addition of endomorphisms of U pointwise

**Exercise 2.2.0.6.** Let  $G \in \mathrm{Obj}(\mathbf{TopGrp})$ . Then  $(\mathrm{Aut}_{\mathbf{TopVect}^{\mathbf{URep}(G)}_{\mathbb{C}}}(U), \mathcal{T}_{\mathcal{E}(U)})$  is a topological unital algebra.

 $\square$ 

### Chapter 3

# Fourier Analysis on $\mathcal{S}(\mathbb{R}^n)$

#### 3.1 Schwartz Space

**Definition 3.1.0.1.** Let  $\alpha \in \mathbb{N}_0^n$  and  $x, y \in \mathbb{R}^n$ . We define

1. 
$$\langle x, y \rangle = \sum_{j} x_{j} y_{j}$$

2. 
$$|x| = \langle x, x \rangle^{1/2}$$

3. 
$$|\alpha| = \alpha_1 + \dots + \alpha_n$$

4. 
$$\alpha! = \prod_{j=1}^{n} \alpha_j!$$

$$5. \ x^{\alpha} = x_1^{\alpha_1} \cdots x_n^{\alpha_n}$$

6. 
$$\partial^{\alpha} = \partial_1^{\alpha_1} \cdots \partial_n^{\alpha_n}$$

7. 
$$\Omega_{\alpha} = \{ (\beta, \gamma) \in \mathbb{N}_0^n \times \mathbb{N}_0^n : \beta + \gamma = \alpha \}$$

**Exercise 3.1.0.2.** Let  $\alpha \in \mathbb{N}_0^n$  and  $j \in \{1, \ldots, n\}$ . Suppose that  $\alpha_j > 0$ . Set  $\eta = \alpha - e_j$ . Then

1. 
$$\Omega_{\eta} = \{ (\beta - e_j, \gamma) : (\beta, \gamma) \in \Omega_{\alpha} \text{ and } \beta_j > 0 \}$$

2. 
$$\Omega_{\eta} = \{(\beta, \gamma - e_j) : (\beta, \gamma) \in \Omega_{\alpha} \text{ and } \gamma_j > 0\}$$

Proof.

1. Set  $A = \{(\beta - e_j, \gamma) : (\beta, \gamma) \in \Omega_{\alpha} \text{ and } \beta_j > 0\}$ . Let  $(\mu, \nu) \in \Omega_{\eta}$ . Set  $\beta = \mu + e_j$  and  $\gamma = \nu$ . Then  $\beta_j > 0$  and

$$\beta + \gamma = \mu + e_j + \nu$$
$$= \eta + e_j$$
$$= \alpha$$

So  $(\beta, \gamma) \in \Omega_{\alpha}$ . Hence

$$(\mu, \nu) = (\beta - e_j, \gamma)$$
$$\in A$$

and  $\Omega_{\eta} \subset A$ .

Conversely, let  $(\mu, \nu) \in A$ . Then there exists  $(\beta, \gamma) \in \Omega_{\alpha}$  such that  $\beta_j > 0$  and  $(\mu, \nu) = (\beta - e_j, \gamma)$ . Then

$$\mu + \nu = \beta - e_j + \gamma$$
$$= \alpha - e_j$$
$$= \eta$$

So that  $(\mu, \nu) \in \Omega_{\eta}$  and  $A \subset \Omega_{\eta}$ . Thus  $\Omega_{\eta} = A$ .

2. Similar to (1).

**Exercise 3.1.0.3.** Let  $f, g \in C^{\infty}(\mathbb{R}^n)$ . Then for each  $\alpha \in \mathbb{N}_0^n$ ,

$$\partial^{\alpha}(fg) = \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (\partial^{\beta} f) (\partial^{\gamma} g)$$

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$ . The claim is true if  $|\alpha| = 0$ . Let k > 0. Suppose that  $|\alpha| > 0$  and that the claim is true for  $|\alpha| = k - 1$  so that for each  $\eta \in \mathbb{N}_0^n$ ,  $|\eta| = k - 1$  implies that

$$\partial^{\eta}(fg) = \sum_{(\beta,\gamma)\in\Omega_{\eta}} \frac{\eta!}{\beta!\gamma!} (\partial^{\beta} f)(\partial^{\gamma} g)$$

Since  $|\alpha| > 0$ , there exists  $j \in \{1, \ldots, n\}$  such that  $\alpha_j > 0$ . Define  $\eta = \alpha - e_j$ . Then the previous exercise implies that

$$\begin{split} &\partial^{\alpha}(fg) = \partial_{j}[\partial^{\eta}(fg)] \\ &= \partial_{j}\left[\sum_{(\beta,\gamma) \in \Omega_{\eta}} \frac{\eta!}{\beta!\gamma!}(\partial^{\beta}f)(\partial^{\gamma}g)\right] \\ &= \sum_{(\beta,\gamma) \in \Omega_{\eta}} \frac{\eta!}{\beta!\gamma!}(\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\eta}} \frac{\eta!}{\beta!\gamma!}(\partial^{\beta}f)(\partial^{\gamma}+e_{j}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\eta!}{(\beta-e_{j})!\gamma!}(\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\eta!}{\beta!(\gamma-e_{j})!}(\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\gamma_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}+\gamma_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} \frac{\beta_{j}+\gamma_{j}}{\alpha_{j}}(\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g) + \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g) \\ &= \sum_{($$

So the claim is true for  $|\alpha| = k$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Exercise 3.1.0.4.** Let  $\xi \in \mathbb{R}^n$ . Define  $f \in \mathbb{C}^{\infty}(\mathbb{R}^n)$  by  $f(x) = e^{-i\langle \xi, x \rangle}$ . Then for each  $\alpha \in \mathbb{N}_0^n$ ,  $\partial^{\alpha} f = (-i\xi)^{\alpha} f$ 

3.1. SCHWARTZ SPACE 17

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$ . The claim is true for  $|\alpha| = 0$ . Let k > 0. Suppose that the claim is true for  $|\alpha| \le k - 1$  so that for each  $\beta \in \mathbb{N}_0$ ,  $|\beta| \le k - 1$  implies that  $\partial^{\beta} f = (-i\xi)^{\beta} f$ . Suppose that  $|\alpha| = k$ . Since k > 0, there exists  $j \in \{1, \ldots, n\}$  such that  $\alpha_j > 0$ . Then

$$\partial^{\alpha} f = \partial_{j} (\partial^{\alpha - e_{j}} f)$$

$$= \partial_{j} ((-i\xi)^{\alpha - e_{j}} f)$$

$$= (-i\xi)^{\alpha - e_{j}} \partial_{j} f$$

$$= (-i\xi)^{\alpha - e_{j}} i\xi_{j}$$

$$= (-i\xi)^{\alpha} f$$

So the claim is true for  $|\alpha| = k$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Definition 3.1.0.5.** Let  $f \in C^{\infty}(\mathbb{R})$ ,  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . We define  $\|\cdot\|_{\alpha,N} : C^{\infty}(\mathbb{R}^n,\mathbb{C}) \to [0,\infty]$  by

$$||f||_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^{\alpha} f(x)| \right]$$

We define **Schwartz space** on  $\mathbb{R}^n$ , denoted  $\mathcal{S}(\mathbb{R}^n)$ , by

$$\mathcal{S}(\mathbb{R}^n) = \{ f \in C^{\infty}(\mathbb{R}^n) : \text{ for each } \alpha \in \mathbb{N}_0^n \text{ and } N \in \mathbb{N}_0, \|f\|_{\alpha,N} < \infty \}$$

**Exercise 3.1.0.6.** For each  $p \in [1, \infty)$  and  $x \in \mathbb{R}^n$ ,

$$(1+|x|)^p > (1/2)(1+|x|^p)$$

*Proof.* Let  $p \in [1, \infty)$  and  $x \in \mathbb{R}^n$ . Suppose that  $p \in \mathbb{Q}$ . Then there exist  $m, n \in \mathbb{N}$  such that  $m \ge n$  and p = m/n. The binomial theorem implies that

$$(1+|x|)^m = \sum_{j=0}^m {m \choose j} |x|^{m-j}$$
$$\geq 1+|x|^m$$

Jensen's inequality implies that

$$(1+|x|)^p = [(1+|x|)^m]^{1/n}$$

$$\geq (1+|x|^m)^{1/n}$$

$$\geq (1/2)^{\frac{n-1}{n}}(1+|x|^p)$$

$$\geq (1/2)(1+|x|^p)$$

Suppose that  $p \notin \mathbb{Q}$ . Choose a sequence  $(p_j)_{j\in\mathbb{N}} \subset [1,\infty) \cap \mathbb{Q}$  such that  $p_j \to p$ . By continuity,

$$(1+|x|)^p = \lim_{j \to \infty} (1+|x|)^{p_j}$$

$$\geq \lim_{j \to \infty} (1/2)(1+|x|^{p_j})$$

$$= (1/2)(1+|x|^p)$$

**Exercise 3.1.0.7.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then f is Lipschitz.

Proof.

1. Set  $M = \max\{\|f\|_{e_j,0} : j \in \{1,\ldots,n\}\}$ . By definition, for each  $j \in \{1,\cdots,n\}$  and  $x \in \mathbb{R}^n$ ,

$$|\partial_j f(x)| \le ||f||_{e_j,0} < M$$

Let  $x, h \in \mathbb{R}^n$ . Jensen's inequality implies that

$$|Df(x)(h)| = \left| \sum_{j=1}^{n} \partial_{j} f(x) h_{j} \right|$$

$$\leq \sum_{j=1}^{n} |\partial_{j} f(x)| |h_{j}|$$

$$\leq M \sum_{j=1}^{n} |h_{j}|$$

$$< \sqrt{n} M |h|$$

Since  $h \in \mathbb{R}^n$  is arbitrary,  $||Df(x)|| \leq \sqrt{n}M$ . Since  $x \in \mathbb{R}^n$  is arbitrary, Df is bounded. Hence f is Lipschitz.

**Exercise 3.1.0.8.** We have that  $\mathcal{S}(\mathbb{R}^n)$  is a vector space and for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,  $\|\cdot\|_{\alpha,N} : \mathcal{S}(\mathbb{R}^n) \to [0,\infty)$  is a seminorm on  $\mathcal{S}(\mathbb{R}^n)$ .

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$ .

1.

$$\|\lambda f\|_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^{\alpha}[\lambda f](x)| \right]$$

$$= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\lambda \partial^{\alpha} f(x)| \right]$$

$$= \sup_{x \in \mathbb{R}} \left[ |\lambda| (1+|x|)^N |\partial^{\alpha} f(x)| \right]$$

$$= |\lambda| \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^{\alpha} f(x)| \right]$$

$$= |\lambda| \|f\|_{\alpha,N}$$

Thus  $\lambda f \in \mathcal{S}(\mathbb{R}^n)$  and  $\|\lambda f\|_{\alpha,N} = |\lambda| \|f\|_{\alpha,N}$ .

2.

$$\begin{split} \|f+g\|_{\alpha,N} &= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\alpha [f+g](x)| \right] \\ &= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |[\partial^\alpha f + \partial^\alpha g](x)| \right] \\ &\leq \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\alpha f(x)| + (1+|x|)^N |\partial^\alpha g(x)| \right] \\ &\leq \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\alpha f(x)| \right] + \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\alpha g(x)| \right] \\ &= \|f\|_{\alpha,N} + \|g\|_{\alpha,N} \end{split}$$

Hence  $f + g \in \mathcal{S}(\mathbb{R}^n)$  and  $||f + g||_{\alpha,N} \le ||f||_{\alpha,N} + ||g||_{\alpha,N}$ .

So  $\mathcal{S}(\mathbb{R}^n)$  is a vector space and  $\|\cdot\|_{\alpha,N}$  is a seminorm on  $\mathcal{S}(\mathbb{R}^n)$ .

3.1. SCHWARTZ SPACE

**Exercise 3.1.0.9.** We have that  $\mathcal{S}(\mathbb{R}^n)$  is a algebra under pointwise multiplication and for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$||fg||_{\alpha,N} \le \sum_{\beta=0}^{\alpha} ||f||_{\beta,N} ||g||_{\alpha-\beta,0}$$

**Hint:**  $\partial^{\alpha}(fg) = \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (\partial^{\beta}f)(\partial^{\gamma}g)$ 

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . Then

$$\begin{split} \|fg\|_{\alpha,N} &= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\alpha (fg)(x)| \right] \\ &= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N \bigg| \sum_{(\beta,\gamma) \in \Omega_\alpha} \frac{\alpha!}{\beta! \gamma!} \partial^\beta f(x) \partial^\gamma g(x) \bigg| \right] \\ &\leq \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N \bigg( \sum_{(\beta,\gamma) \in \Omega_\alpha} \frac{\alpha!}{\beta! \gamma!} |\partial^\beta f(x)| |\partial^\gamma g(x)| \bigg) \right] \\ &= \sup_{x \in \mathbb{R}} \left[ \sum_{(\beta,\gamma) \in \Omega_\alpha} \frac{\alpha!}{\beta! \gamma!} (1+|x|)^N |\partial^\beta f(x)| |\partial^\gamma g(x)| \right] \\ &\leq \sum_{(\beta,\gamma) \in \Omega_\alpha} \frac{\alpha!}{\beta! \gamma!} \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\beta f(x)| |\partial^\gamma g(x)| \right] \\ &\leq \sum_{(\beta,\gamma) \in \Omega_\alpha} \frac{\alpha!}{\beta! \gamma!} \sup_{x \in \mathbb{R}} \left[ (1+|x|)^N |\partial^\beta f(x)| \right] \sup_{x \in \mathbb{R}} \left[ |\partial^\gamma g(x)| \right] \\ &= \sum_{(\beta,\gamma) \in \Omega_\alpha} \frac{\alpha!}{\beta! \gamma!} \|f\|_{\beta,N} \|g\|_{\gamma,0} \\ &\leq \infty \end{split}$$

So  $fg \in \mathcal{S}(\mathbb{R}^n)$ .

**Definition 3.1.0.10.** Set  $\mathcal{P} = \{ \| \cdot \|_{\alpha,N} : \alpha \in \mathbb{N}_0^n, N \in \mathbb{N}_0 \}$ . Then  $\mathcal{P}$  is a countable family of seminorms on  $\mathcal{S}(\mathbb{R}^n)$ . We equip  $\mathcal{S}(\mathbb{R}^n)$  with the topology  $\mathcal{T}$  induced by the family of projections

$$\pi_{\|\cdot\|_{\alpha,N}}: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)/\ker \|\cdot\|_{\alpha,N}$$

i.e.  $\mathcal{T} = \tau_{\mathcal{S}(\mathbb{R}^n)}((\pi_p)_{p \in \mathcal{P}}).$ 

Explicitly, for a net  $(f_{\gamma})_{{\gamma}\in\Gamma}\subset\mathcal{S}(\mathbb{R}^n)$  and  $f\in\mathcal{S}(\mathbb{R}^n)$ ,  $f_{\gamma}\to f$  iff for each  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}_0$ ,  $\|f_{\gamma}-f\|_{\alpha,N}\to 0$ . Hence  $(\mathcal{S}(\mathbb{R}^n),\mathcal{T})$  is a locally convex space. Since  $\mathcal{P}$  is countable, we may write  $\mathcal{P}=(p_j)_{j\in\mathbb{N}}$  and thus  $(\mathcal{S}(\mathbb{R}^n),\mathcal{T})$  is metrizable with metric

$$d_{\mathcal{S}(\mathbb{R}^n)}(f,g) = \sum_{j \in \mathbb{N}} 2^{-j} \frac{p_j(f-g)}{1 + p_j(f-g)}$$

**Exercise 3.1.0.11.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . For each  $p \in [1, \infty]$ ,  $f \in L^p(\mathbb{R}^n)$ 

*Proof.* Let  $p \in [1, \infty]$ . Suppose that  $p < \infty$ . The previous exercise implies that for each  $x \in \mathbb{R}$ ,

$$(1+|x|)^{2p} \ge (1/2)(1+|x|^{2p})$$

By definition, there exists  $C \geq 0$  such that for each  $x \in \mathbb{R}$ ,

$$|f(x)| < C(1+|x|)^{-2}$$

Then for each  $x \in \mathbb{R}$ ,

$$|f(x)|^p \le C^p (1+|x|)^{-2p}$$
  
 $\le 2C^p (1+|x|^{2p})^{-1}$ 

Define  $g: \mathbb{R}^n \to [0, \infty)$  defined by  $g(x) = 2C^p(1 + |x|^{2p})^{-1}$ . Since  $g \in L^1(m)$  and  $|f|^p \leq g$ , we have that  $f \in L^p(\mathbb{R}^n)$ . If  $p = \infty$ , then by definition,

$$||f||_{\infty} = ||f||_{0,0}$$
< \infty

So  $f \in L^p(\mathbb{R}^n)$ .

**Exercise 3.1.0.12.** For each  $p \in [1, \infty)$ , the inclusion  $\iota : \mathcal{S}(\mathbb{R}^n) \to L^p(\mathbb{R}^n)$  is continuous.

*Proof.* Let  $(f_j)_{j\in\mathbb{N}}\subset\mathcal{S}(\mathbb{R}^n)$  and  $f\in\mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_j\to f$ . Then for each  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}_0$ ,  $||f_j-f||_{\alpha,N}\to 0$ . By definition, for each  $x\in\mathbb{R}$ ,

$$|f_j(x) - f(x)| \le ||f_j - f||_{0,2} (1 + |x|)^{-2}$$

Therefore, for each  $x \in \mathbb{R}$ ,

$$||f_{j} - f||_{p}^{p} = \int_{\mathbb{R}^{n}} |f_{j} - f|^{p} dm$$

$$\leq \int_{\mathbb{R}^{n}} ||f_{j} - f||_{0,2}^{p} (1 + |x|)^{-2p} dm(x)$$

$$\leq ||f_{j} - f||_{0,2}^{p} \int_{\mathbb{R}^{n}} 2(1 + |x|^{2p})^{-1} dm(x)$$

$$= ||f_{j} - f||_{0,2}^{p} \int_{\mathbb{R}^{n}} 2(1 + |x|^{-2p})^{-1} dm(x)$$

$$\to 0$$

Hence  $f_j \xrightarrow{L^p} f$  and  $\iota : \mathcal{S}(\mathbb{R}^n) \to L^p(\mathbb{R}^n)$  is continuous.

**Exercise 3.1.0.13.** For each  $\alpha \in \mathbb{N}_0^n$ ,  $\partial^{\alpha} : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

Proof. Let  $\alpha \in \mathbb{N}_0^n$ . The claim is true for  $|\alpha| = 0$  and  $|\alpha| = 1$ . Let k > 1. Suppose that the claim is true for  $|\alpha| = k - 1$  so that for each  $\beta \in \mathbb{N}_0^n$ ,  $|\beta| = k - 1$  implies that  $\partial^{\beta} : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}$  is linear. Suppose that  $|\alpha| = k$ . Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$ . Since k > 0, there exists  $j \in \{1, \ldots, n\}$  such that  $\alpha_j > 0$ . Then

$$\begin{split} \partial^{\alpha}(f + \lambda g) &= \partial_{j}(\partial^{\alpha - e_{j}}[f + \lambda g]) \\ &= \partial_{j}(\partial^{\alpha - e_{j}}f + \lambda \partial^{\alpha - e_{j}}g) \\ &= \partial_{j}(\partial^{\alpha - e_{j}}f) + \lambda \partial_{j}(\partial^{\alpha - e_{j}}g) \\ &= \partial^{\alpha}f + \lambda \partial^{\alpha}q \end{split}$$

Since  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$  are arbitrary, we have that  $\partial^{\alpha}$  is linear. So the claim is true for  $|\alpha| = k$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Exercise 3.1.0.14.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $\alpha \in \mathbb{N}_0^n$ . Then  $\partial^{\alpha} f \in \mathcal{S}(\mathbb{R}^n)$  and for each  $\beta \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$\|\partial^{\alpha} f\|_{\beta,N} \le \|f\|_{\alpha+\beta,N}$$

*Proof.* Let  $f \in \mathcal{S}(\mathbb{R}^n)$ ,  $\beta \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . By definition,

$$\|\partial^{\alpha} f\|_{\beta,N} = \sup_{x \in \mathbb{R}} \left[ (1 + |x|)^{N} |\partial^{\beta} (\partial^{\alpha} f)(x)| \right]$$
$$= \sup_{x \in \mathbb{R}} \left[ (1 + |x|)^{N} |\partial^{\alpha+\beta} f(x)| \right]$$
$$= \|f\|_{\alpha+\beta,N}$$
$$< \infty$$

So  $\partial^{\alpha} f \in \mathcal{S}(\mathbb{R}^n)$ .

3.1. SCHWARTZ SPACE 21

**Exercise 3.1.0.15.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$||f||_{\alpha,N} = ||\partial^{\alpha} f||_{0,N}$$

*Proof.* Clear by preceding exercise.

**Exercise 3.1.0.16.** Let  $\alpha \in \mathbb{N}_0^n$ . Then  $\partial^{\alpha} : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

*Proof.* Let  $(f_k)_{k\in\mathbb{N}}\subset\mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_k\to 0$ . Then for each  $\alpha,N\in\mathbb{N}_0,$   $\|f_k\|_{\alpha,N}\to 0$ . Let  $\beta\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}$ . Then

$$\|\partial^{\alpha} f_k\|_{\beta,N} \le \|f_k\|_{\alpha+\beta,N}$$
  
\$\to 0\$

Since  $\beta \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $\partial^{\alpha} f_k \to 0$ . Thus  $\partial^{\alpha}$  is continuous at 0. Since  $\partial^{\alpha}$  is linear,  $\partial^{\alpha}$  is continuous.

#### 3.2 Position and Momentum Operators

**Definition 3.2.0.1.** Let  $j \in \{1, ..., n\}$ . We define the j-th position operator, denoted  $X_j : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  by

$$X_j f(x) = x_j f(x)$$

**Exercise 3.2.0.2.** Let  $j \in \{1, \ldots, n\}$ . Then  $X_j : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$ . Then for each  $x \in \mathbb{R}^n$ , we have that

$$X_{j}(f + \lambda g)(x) = x_{j}(f(x) + \lambda g(x))$$
$$= x_{j}f(x) + \lambda x_{j}g(x)$$
$$= (X_{i}f + \lambda X_{i}g)(x)$$

Since  $x \in \mathbb{R}^n$  is arbitrary, we have that  $X_j(f + \lambda g) = X_j f + \lambda X_j g$ . Since  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$  are arbitrary, we have that  $X_j$  is linear.

**Exercise 3.2.0.3.** For each  $j \in \{1, ..., n\}$  and  $\alpha \in \mathbb{N}_0^n$ ,

$$\partial^{\alpha} X_{j} = \begin{cases} X_{j} \partial^{\alpha} & \alpha_{j} = 0 \\ X_{j} \partial^{\alpha} + \alpha_{j} \partial^{\alpha - e_{j}} & \alpha_{j} > 0 \end{cases}$$

*Proof.* Let  $j \in \{1, ..., n\}$ ,  $\alpha \in \mathbb{N}_0^n$  and  $f \in \mathcal{S}(\mathbb{R}^n)$ . The claim is true if  $\alpha_j = 0$  or  $\alpha_j = 1$ . Let k > 1. Suppose that the claim is true for  $\alpha_j = k - 1$  so that  $\partial_j^{k-1}(X_j f) = X_j(\partial_j^{k-1} f) + (k-1)\partial_j^{k-2} f$ . Suppose that  $\alpha_j = k$ . Then

$$\begin{split} (\partial_j^k X_j)f &= \partial_j^k (X_j f) \\ &= \partial_j (\partial_j^{k-1} [X_j f]) \\ &= \partial_j (X_j [\partial_j^{k-1} f] + (k-1) \partial_j^{k-2}) \\ &= \partial_j (X_j [\partial_j^{k-1} f]) + (k-1) \partial_j (\partial_j^{k-2} f) \\ &= (X_j [\partial_j^k f] + \partial_j^{k-1} f) + (k-1) \partial_j^{k-1} f \\ &= X_j (\partial_j^k f) + k \partial_j^{k-1} f \\ &= (X_j \partial_j^k + k \partial_j^{k-1}) f \end{split}$$

which implies that

$$\begin{split} (\partial^{\alpha}X_{j})f &= \partial^{\alpha}(X_{j}f) \\ &= \partial^{\alpha-ke_{j}}(\partial_{j}^{k}[X_{j}f]) \\ &= \partial^{\alpha-ke_{j}}(X_{j}[\partial_{j}^{k}f] + k\partial_{j}^{k-1}f) \\ &= X_{j}(\partial^{\alpha-ke_{j}}[\partial_{j}^{k}f]) + k\partial^{\alpha-ke_{j}}(\partial_{j}^{k-1}f) \\ &= X_{j}(\partial^{\alpha}f) + \alpha_{j}\partial^{\alpha-e_{j}}f \\ &= (X_{j}\partial^{\alpha} + \alpha_{j}\partial^{\alpha-e_{j}})f \end{split}$$

So the claim is true for  $\alpha_i = k$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Exercise 3.2.0.4.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $j \in \{1, ..., n\}$ . Then  $X_j f \in \mathcal{S}(\mathbb{R}^n)$  and for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$||X_j f||_{\alpha, N} \le \begin{cases} ||f||_{\alpha, N+1} & \alpha_j = 0\\ ||f||_{\alpha, N+1} + \alpha_j ||f||_{\alpha - e_j, N} & \alpha_j > 0 \end{cases}$$

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . If  $\alpha_j = 0$ , then the previous exercise implies that

$$||X_{j}f||_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha}(X_{j}f)(x)| \right]$$

$$= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |x_{j}\partial^{\alpha}f(x)| \right]$$

$$\leq \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N+1} |\partial^{\alpha}f(x)| \right]$$

$$= ||f||_{\alpha,N+1}$$

$$< \infty$$

If  $\alpha_j > 0$ , then the previous exercise implies that

$$\begin{split} \|X_{j}f\|_{\alpha,N} &= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha}(X_{j}f)(x)| \right] \\ &= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |x_{j}\partial^{\alpha}f(x) + \alpha_{j}\partial^{\alpha-e_{j}}f(x)| \right] \\ &\leq \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N+1} |\partial^{\alpha}f(x)| \right] + \alpha_{j} \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha-e_{j}}f(x)| \right] \\ &= \|f\|_{\alpha,N+1} + \alpha_{j} \|f\|_{\alpha-e_{j},N} \\ &< \infty \end{split}$$

Since  $\alpha, N \in \mathbb{N}_0$  are arbitrary,  $X_i f \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.2.0.5.** Let  $j \in \{1, ..., n\}$ . Then  $X_j : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

*Proof.* Let  $(f_k)_{k\in\mathbb{N}}\subset\mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_k\to 0$ . Then for each  $\alpha,N\in\mathbb{N}_0,\ \|f_k\|_{\alpha,N}\to 0$ . Let  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}$ . If  $\alpha_j=0$ , then

$$||X_j f_k||_{\alpha, N} \le ||f_k||_{\alpha, N+1}$$
$$\to 0$$

If  $\alpha_j > 0$ , then

$$||X_j f_k||_{\alpha,N} \le ||f_k||_{\alpha,N+1} + \alpha_j ||f_k||_{\alpha - e_j,N}$$
  
  $\to 0$ 

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $X_j f_k \to 0$ . Thus  $X_j$  is continuous at 0. Since  $X_j$  is linear,  $X_j$  is continuous.

**Exercise 3.2.0.6.** Let  $j, k \in \{1, ..., n\}$ . Then  $X_j X_k = X_k X_j$ .

*Proof.* Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then

$$([X_j X_k]f)(x) = (X_j [X_k f])(x)$$

$$= x_j (X_k f)(x)$$

$$= x_j x_k f(x)$$

$$= x_k x_j f(x)$$

$$= x_k (X_j f)(x)$$

$$= (X_k [X_j f])(x)$$

$$= ([X_k X_j ]f)(x)$$

Since  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $x \in \mathbb{R}^n$  are arbitrary,  $X_j X_k = X_k X_j$ .

**Definition 3.2.0.7.** Let  $\alpha \in \mathbb{N}_0^n$ . We define  $X^{\alpha} : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  by  $X^{\alpha} = X_1^{\alpha_1} \cdots X_n^{\alpha_n}$ 

**Definition 3.2.0.8.** Let  $j \in \{1, ..., n\}$ . We define the j-th momentum operator, denoted  $P_j : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  by

$$P_j = -i\partial_j$$

**Exercise 3.2.0.9.** Let  $j \in \{1, ..., n\}$ . Then  $P_j : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

*Proof.* Clear since  $\partial_i : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

**Exercise 3.2.0.10.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $j \in \{1, ..., n\}$ . Then  $P_j f \in \mathcal{S}(\mathbb{R}^n)$  and for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$||P_i f||_{\alpha,N} \le ||f||_{\alpha+e_i,N}$$

*Proof.* Clear since  $\partial_j f \in \mathcal{S}(\mathbb{R}^n)$  and  $\|\partial_j f\|_{\alpha,N} \leq \|f\|_{\alpha+e_j,N}$ .

**Exercise 3.2.0.11.** Let  $j \in \{1, ..., n\}$ . Then  $P_j : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

*Proof.* Clear cince  $\partial_i : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

**Exercise 3.2.0.12.** Let  $j, k \in \{1, ..., n\}$ . Then  $P_j P_k = P_k P_j$ .

*Proof.* Clear since  $\partial_i \partial_k = \partial_k \partial_i$ .

**Definition 3.2.0.13.** Let  $\alpha \in \mathbb{N}_0^n$ . We define  $P^{\alpha} : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  by  $P^{\alpha} = P_1^{\alpha_1} \cdots P_n^{\alpha_n}$ 

**Exercise 3.2.0.14.** Let  $j, k \in \{1, ..., n\}$ . Then  $[X_j, P_k] = i\delta_{j,k}$ .

*Proof.* A previous exercise implies that  $\partial_k X_j = X_j \partial_k + \delta_{j,k} I$ . Therefore

$$\begin{split} [X_j,P_k] &= X_j P_k - P_k X_j \\ &= -i(X_j \partial_k - \partial_k X_j) \\ &= -i(X_j \partial_k - [X_j \partial_k + \delta_{j,k} I]) \\ &= -i\delta_{j,k} I \end{split}$$

#### 3.3 Translation and Rotation Operators

**Definition 3.3.0.1.** Let  $y \in \mathbb{R}^n$ . We define the **translation by** y **operator**, denoted  $\tau_y : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$ , by  $\tau_y f(x) = f(x-y)$ .

**Exercise 3.3.0.2.** Let  $\alpha \in \mathbb{N}_0$ . Then for each  $y \in \mathbb{R}^n$ ,

$$\partial^{\alpha} \tau_{y} = \tau_{y} \partial^{\alpha}$$

*Proof.* Let  $y \in \mathbb{R}^n$ . The claim is true if  $|\alpha| = 0$ . Let  $k \ge 1$ . Suppose that the claim is true for  $|\alpha| \le k - 1$  so that for each  $\beta \in \mathbb{N}_0^n$ ,  $|\beta| \le k - 1$  implies that

$$\partial^{\beta} \tau_y = \tau_y \partial^{\beta}$$

Suppose that  $|\alpha| = k$ . Since k > 0, there exists  $j \in \{1, ..., n\}$  such that  $\alpha_j > 0$ . Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Define  $g : \mathbb{R}^n \to \mathbb{R}^n$  and  $g_k : \mathbb{R}^n \to \mathbb{R}$  by g(x) = x - y and  $g_k = \pi_k \circ g$ . Then the chain rule implies that

$$(\partial^{\alpha} \tau_{y}) f = \partial^{\alpha} (\tau_{y} f)$$

$$= \partial_{j} (\partial^{\alpha - e_{j}} [\tau_{y} f])$$

$$= \partial_{j} (\tau_{y} [\partial^{\alpha - e_{j}} f])$$

$$= \partial_{j} ([\partial^{\alpha - e_{j}} f] \circ g)$$

$$= \sum_{k=1}^{n} [\partial_{k} (\partial^{\alpha - e_{j}} f) \circ g] \partial_{j} g_{k}$$

$$= \partial_{j} (\partial^{\alpha - e_{j}} f) \circ g$$

$$= (\partial^{\alpha} f) \circ g$$

$$= \tau_{y} (\partial^{\alpha} f)$$

$$= (\tau_{y} \partial^{\alpha}) f$$

Since  $f \in \mathcal{S}(\mathbb{R}^n)$  is arbitrary,  $\partial^{\alpha} \tau_y = \tau_y \partial^{\alpha}$ . Hence the claim is true for  $|\alpha| = k$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Exercise 3.3.0.3.** Let  $y \in \mathbb{R}$ . Then for each  $x \in \mathbb{R}^n$ ,  $(1 + |x|) \le (1 + |y|)(1 + |x - y|)$ .

*Proof.* Let  $x \in \mathbb{R}$ . Then

$$(1+|y|)(1+|x-y|) = 1 + (|x-y|+|y|) + |y||x-y|$$

$$\geq 1 + |x| + |y||x-y|$$

$$\geq 1 + |x|$$

**Exercise 3.3.0.4.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $y \in \mathbb{R}^n$ . Then  $\tau_y f \in \mathcal{S}(\mathbb{R}^n)$  and for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$\|\tau_y f\|_{\alpha,N} \le (1+|y|)^N \|f\|_{\alpha,N}$$

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . Then

$$\|\tau_{y}f\|_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha}\tau_{y}f(x)| \right]$$

$$= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\tau_{y}\partial^{\alpha}f(x)| \right]$$

$$= \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha}f(x-y)| \right]$$

$$\leq \sup_{x \in \mathbb{R}} \left[ (1+|y|)^{N} (1+|x-y|)^{N} |\partial^{\alpha}f(x-y)| \right]$$

$$= (1+|y|)^{N} \sup_{x \in \mathbb{R}} \left[ (1+|x-y|)^{N} |\partial^{\alpha}f(x-y)| \right]$$

$$= (1+|y|)^{N} \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha}f(x)| \right]$$

$$= (1+|y|)^{N} \|f\|_{\alpha,N}$$

$$< \infty$$

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $\tau_y f \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.3.0.5.** Let  $y \in \mathbb{R}^n$ . Then

- 1.  $\tau_y: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous,
- 2.  $\tau_y: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is linear,
- 3.  $\tau_y: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  a bijection,
- 4.  $\tau_u \in \operatorname{Aut}_{\mathbf{TopVect}_{\mathcal{C}}}(\mathcal{S}(\mathbb{R}^n)).$

Proof.

• Let  $(f_k)_{k\in\mathbb{N}}\subset\mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_k\to 0$ . Then for each  $\alpha,N\in\mathcal{N}_0, \|f_k\|_{\alpha,N}\to 0$ . Let  $\alpha,N\in\mathcal{N}_0$ . Then

$$\|\tau_y f_k\|_{\alpha,N} \le (1+|y|)^N \|f_k\|_{\alpha,N}$$
  
  $\to 0$ 

Since  $\alpha, N \in \mathbb{N}_0$  are arbitrary,  $\tau_y f_k \to 0$ . So  $\tau_y$  is continuous at 0. Since  $\tau_y$  is linear,  $\tau_y$  is continuous.

• Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$ . Then for each  $x \in \mathbb{R}^n$ , we have that

$$\tau_y(f + \lambda g)(x) = (f + \lambda g)(x - y)$$

$$= f(x - y) + \lambda g(x - y)$$

$$= \tau_y f(x) + \lambda \tau_y g(x)$$

Since  $x \in \mathbb{R}^n$  is arbitrary, we have that  $\tau_y(f + \lambda g) = \tau_y f + \lambda \tau_y g$ . Since  $f, g \in \mathcal{S}(\mathbb{R}^n)$  are arbitrary,  $\tau_y$  is linear.

- Clearly  $(\tau_y)^{-1} = \tau_{-y}$ .
- Immediate by the previous parts.

**Definition 3.3.0.6.** We define  $\tau : \mathbb{R}^n \to \operatorname{Aut}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^n))$  by  $\tau(y) := \tau_y$ .

**Definition 3.3.0.7.** We equip  $\operatorname{End}_{\mathbf{TopVect}_{\mathcal{C}}}(\mathcal{S}(\mathbb{R}^n))$  with the strong operator topology. link to details

Note 3.3.0.8. This means that for a net  $(T_{\alpha})_{\alpha \in A} \subset \operatorname{Aut}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^{n}))$ , and  $T \in \operatorname{Aut}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^{n}))$ ,  $T_{\alpha} \to T$  in  $\operatorname{Aut}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^{n}))$  iff for each  $f \in \mathcal{S}(\mathbb{R}^{n})$ ,  $T_{\alpha}f \to Tf$  in  $\mathcal{S}(\mathbb{R}^{n})$ .

#### Exercise 3.3.0.9. We have that

- 1.  $\tau: \mathbb{R}^n \to \operatorname{End}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^n))$  is a homomorphism.
- 2.  $\tau \in \text{Hom}_{\textbf{TopMon}}(\mathbb{R}^n, \text{End}_{\textbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^n)))$ .

Proof.

1. Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $x, y \in \mathbb{R}^n$ . Then for each  $z \in \mathbb{R}^n$ ,

$$[\tau_{x+y}f](z) = f(z - (x+y))$$

$$= f(z - x - y)$$

$$= [\tau_y f](z - x)$$

$$= [\tau_x [\tau_y f]](z)$$

Since  $z \in \mathbb{R}^n$  is arbitrary, we have that  $\tau_{x+y}f = \tau_x\tau_yf$ . Since f is arbitrary, we have that

$$\tau(x+y) = \tau_{x+y}$$

$$= \tau_x \tau_y$$

$$= \tau(x)\tau(y).$$

Since  $x, y \in \mathbb{R}^n$  are arbitrary, we have that for each  $x, y \in \mathbb{R}^n$ ,  $\tau(x+y) = \tau(x)\tau(y)$ . Thus  $\tau$  is a homomorphism.

2. Let  $(S_{\alpha})_{\alpha \in A}$ ,  $(T_{\alpha})_{\alpha \in A} \subset \operatorname{End}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^{n}))$  be nets and  $S, T \in \operatorname{End}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^{n}))$ . Suppose that  $S_{\alpha} \to S$   $T_{\alpha} \to T$ . Then for each  $f \in \mathcal{S}(\mathbb{R}^{n})$ ,

$$S_{\alpha}T_{\alpha}f - STf = S_{\alpha}T_{\alpha}f - ST_{\alpha}f + ST_{\alpha}f - STf$$
$$= (S_{\alpha} - S)T_{\alpha}f + S(T_{\alpha} - T)f$$
$$=$$

FINISH!!!

Exercise 3.3.0.10.

- 1. Let  $f \in C_c(\mathbb{R}^n)$ . Define  $g : \mathbb{R}^n \to \mathcal{S}(\mathbb{R}^n)$  by  $g(y) := \tau_y f$ . Then g is continuous.
- 2.  $\tau: \mathbb{R}^n \to \operatorname{Aut}_{\mathbf{TopVect}_{\mathbb{C}}}(\mathcal{S}(\mathbb{R}^n))$  is continuous.

Proof.

1. Let  $\alpha \in \mathbb{N}_0^n$  and  $\mathbb{N} \in \mathbb{N}_0$  and  $\epsilon > 0$  and  $y \in \mathbb{R}^n$ . Suppose that  $|y| \leq 1$ .

Since  $\partial^{\alpha} f \in \mathcal{S}(\mathbb{R}^n)$ , a previous exercise implies that  $\partial^{\alpha}$  is Lipschitz. Thus there exists  $C \geq 0$  such that for each  $x, y \in \mathbb{R}^n$ ,  $|\partial^{\alpha} f(x) - \partial^{\alpha} f(y)| \leq C|x-y|$ .

Since  $f \in C_c(\mathbb{R}^n)$ ,  $\partial^{\alpha} f \in C_c(\mathbb{R}^n)$ . Define  $K_y \subset \mathbb{R}^n$  by  $K_y := \sup \partial^{\alpha} f \cup [y + (\sup \partial^{\alpha} f)^c]^c$ . We note that  $K_y$  is compact and since  $K_y^c = (\sup \partial^{\alpha} f)^c \cap [y + (\sup \partial^{\alpha} f)^c]$ , for each  $x \in K_y^c$ ,  $\partial^{\alpha} f(x) = 0$  and  $\partial^{\alpha} f(x - y) = 0$ .

Since  $y \in \mathbb{R}^n$  with  $|y| \le 1$  is arbitrary, we have that for each  $y \in \mathbb{R}^n$ ,  $|y| \le 1$  implies that there exists  $K_y \subset \mathbb{R}^n$  such that  $K_y$  is compact and for each  $x \in K_y^c$ ,  $\partial^{\alpha} f(x) = 0$  and  $\partial^{\alpha} f(x - y) = 0$ .

There exists  $K \subset \mathbb{R}^n$  such that K is compact and for each  $y \in \mathbb{R}^n$ ,  $|y| \le 1$  implies that  $K_y \subset K$ . Thus for each  $x \in K^c$ , f(x) = 0 and f(x - y) = 0.

Define M > 1 by  $M := \sup_{x \in K} (1 + |x|)^N$ . Choose  $\delta := \epsilon [M(C+1)]^{-1}$ . Let  $y \in \mathbb{R}^n$ . Suppose that  $|y| < \delta$ . Then

$$\begin{split} \|g(y) - g(0)\|_{\alpha,N} &= \|\tau_y f - f\|_{\alpha,N} \\ &= \sup_{x \in \mathbb{R}^n} \left[ (1 + |x|)^N |\partial^\alpha \tau_y f(x) - \partial^\alpha f(x)| \right] \\ &= \sup_{x \in \mathbb{R}^n} \left[ (1 + |x|)^N |\tau_y \partial^\alpha f(x) - \partial^\alpha f(x)| \right] \\ &= \sup_{x \in \mathbb{R}^n} \left[ (1 + |x|)^N |\partial^\alpha f(x - y) - \partial^\alpha f(x)| \right] \\ &= \sup_{x \in K} \left[ (1 + |x|)^N |\partial^\alpha f(x - y) - \partial^\alpha f(x)| \right] \\ &\leq |y| C \sup_{x \in K} (1 + |x|)^N \\ &\leq |y| C M \\ &< \delta C M \\ &= \frac{\epsilon C M}{(C + 1) M} \\ &< \epsilon. \end{split}$$

Since  $\epsilon > 0$  is arbitrary, we have that for each  $\epsilon > 0$ , there exists  $\delta > 0$  such that for each  $y \in \mathbb{R}^n$ ,  $|y| < \delta$  implies that  $||g(y) - g(0)||_{\alpha,N} < \epsilon$ . Thus g is continuous at 0. FINISH!!!, to show continuous, maybe show that  $\operatorname{Aut}(\mathcal{S}(\mathbb{R}^n))$  is a topological semigroup and show that a homomorphism between semigroups is continuous iff it is continuous at semigroup identity i.e. 0

2. Let  $f \in \mathcal{S}(\mathbb{R}^n)$ ,  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . Recalling Definition 3.1.0.10, we note that there exists  $j \in \mathbb{N}$  such that  $p_j = \|\cdot\|_{\alpha,N}$ . Then there exists  $f_0 \in C_c^{\infty}(\mathbb{R}^n)$  such that  $d_{\mathcal{S}(\mathbb{R}^n)}(f, f_0) < 2^{-j} \epsilon/3$ . Therefore

$$2^j \|f - f_0\|_{\alpha, N} \le 2^j$$

FINISH!!! Then

$$\|\tau_{y}f - f\|_{\alpha,N} \leq \|\tau_{y}f - \tau_{y}f_{0}\|_{\alpha,N} + \|\tau_{y}f_{0} - f_{0}\|_{\alpha,N} + \|f_{0} - f\|_{\alpha,N}$$

$$\leq 2^{j(\alpha,N)}p_{\alpha,N}(\tau_{y}f - \tau_{y}f_{0}) + \|\tau_{y}f_{0} - f_{0}\|_{\alpha,N} + 2^{j(\alpha,N)}p_{\alpha,N}(f_{0} - f)$$

$$\leq$$

FINISH!!!

**Exercise 3.3.0.11.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Define  $g : \mathbb{R}^n \to L^1(\mathbb{R}^n)$  by  $g(y) := \tau_y f$ . Then g is continuous. **Hint:** approximate by functions in  $C_c(\mathbb{R})$ . maybe move this to integration notes

*Proof.* Suppose that  $f \in C_c(\mathbb{R})$ . Then

$$g(x+y) - g(x) = \tau_{x+y}f - \tau_x f$$
$$= \tau_x [\tau_y f] - \tau_x f$$
$$= \tau_x (\tau_y f - f)$$

Exercise 3.3.0.12. Let  $f \in \mathcal{S}(\mathbb{R}^n)$ .

1. Define  $g: \mathbb{R}^n \to L^1(\mathbb{R}^n)$  by  $g(y) := \tau_y f$ . If

2. Define  $g: \mathbb{R}^n \to L^1(\mathbb{R}^n)$  by  $g(y) := \tau_y f$ . If  $f \in C_c(\mathbb{R}^n)$ , then g is continuous need to show  $\mathbb{R}^n \to L^1(\mathbb{R}^n)$  given by  $y \mapsto \tau_y f$  is continuous, approx by  $C_c(\mathbb{R}^n)$  using uniform continuity.

3.

**Definition 3.3.0.13.** Let  $\xi \in \mathbb{R}^n$ . We define the **rotation by**  $\xi$  **operator**, denoted  $\rho_{\xi} : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$ , by  $\rho_{\xi} f(x) = e^{-i\langle \xi, x \rangle} f(x)$ .

**Exercise 3.3.0.14.** Let  $\xi \in \mathbb{R}^n$ . Then  $\rho_{\xi} : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$ . Then for each  $x \in \mathbb{R}^n$ , we have that

$$\begin{split} \rho_{\xi}(f+\lambda g)(x) &= e^{-i\langle \xi, x\rangle}(f+\lambda g)(x) \\ &= e^{-i\langle \xi, x\rangle}f(x) + \lambda e^{-i\langle \xi, x\rangle}g(x) \\ &= \rho_{\xi}f(x) + \lambda \rho_{\xi}g(x) \end{split}$$

Since  $x \in \mathbb{R}^n$  is arbitrary, we have that  $\rho_{\xi}(f + \lambda g) = \rho_{\xi}f + \lambda \rho_{\xi}g$ . Since  $f, g \in \mathcal{S}(\mathbb{R}^n)$  are arbitrary,  $\rho_{\xi}$  is linear.

**Exercise 3.3.0.15.** Let  $\xi \in \mathbb{R}^n$ . Then for each  $\alpha \in \mathbb{N}_0^n$ ,

$$\partial^{\alpha} \rho_{\xi} = \rho_{\xi} \sum_{(\beta, \gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (-i\xi)^{\beta} \partial^{\gamma}$$

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$  and  $f \in \mathcal{S}(\mathbb{R}^n)$ . Define  $g \in C^{\infty}(\mathbb{R}^n)$  by  $g(x) = e^{-i\langle \xi, x \rangle}$ . A previous exercise implies that

$$(\partial^{\alpha} \rho_{\xi}) f = \partial^{\alpha} (\rho_{\xi} f)$$

$$= \partial^{\alpha} (g f)$$

$$= \sum_{(\beta, \gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (\partial^{\beta} g) (\partial^{\gamma} f)$$

$$= \sum_{(\beta, \gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} ((-i\xi)^{\beta} g) (\partial^{\gamma} f)$$

$$= \sum_{(\beta, \gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (-i\xi)^{\beta} \rho_{\xi} (\partial^{\gamma} f)$$

$$= \rho_{\xi} \left( \sum_{(\beta, \gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (-i\xi)^{\beta} \partial^{\gamma} f \right)$$

$$= \left( \rho_{\xi} \sum_{(\beta, \gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (-i\xi)^{\beta} \partial^{\gamma} \right) f$$

Since  $f \in \mathcal{S}(\mathbb{R}^n)$  is arbitrary,

$$\partial^{\alpha} \rho_{\xi} = \rho_{\xi} \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta! \gamma!} (-i\xi)^{\beta} \partial^{\gamma}$$

**Exercise 3.3.0.16.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $\xi \in \mathbb{R}^n$ . Then  $\rho_{\xi} f \in \mathcal{S}(\mathbb{R}^n)$  and for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$\|\rho_{\xi}f\|_{\alpha,N} \le \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} |\xi^{\beta}| \|f\|_{\gamma,N}$$

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$ ,  $N \in \mathbb{N}_0$  and  $x \in \mathbb{R}^n$ . Then

$$(1+|x|)^{N}|\partial^{\alpha}(\rho_{\xi}f)(x)| = (1+|x|)^{N} \left| \rho_{\xi} \left( \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (-i\xi)^{\beta} \partial^{\gamma} f \right)(x) \right|$$

$$= (1+|x|)^{N} \left| e^{-i\langle \xi, x \rangle} \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} (-i\xi)^{\beta} \partial^{\gamma} f(x) \right|$$

$$\leq (1+|x|)^{N} \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} |\xi^{\beta}| |\partial^{\gamma} f(x)|$$

$$= \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} |\xi^{\beta}| |(1+|x|)^{N} \partial^{\gamma} f(x)|$$

$$\leq \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} |\xi^{\beta}| ||f||_{\gamma,N}$$

Since  $x \in \mathbb{R}^n$  is arbitrary, we have that

$$\|\rho_{\xi}f\|_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1+|x|)^{N} |\partial^{\alpha}(\rho_{\xi}f)(x)| \right]$$

$$\leq \sum_{(\beta,\gamma) \in \Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} |\xi^{\beta}| \|f\|_{\gamma,N}$$

$$< \infty$$

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $\rho_{\xi} f \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.3.0.17.** Let  $\xi \in \mathbb{R}^n$ . Then  $\rho_{\xi} : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

*Proof.* Let  $(f_k)_{k\in\mathbb{N}}\subset\mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_k\to 0$ . Then for each  $\alpha,N\in\mathcal{N}_0, \|f_k\|_{\alpha,N}\to 0$ . Let  $\alpha,N\in\mathcal{N}_0$ . Then

$$\|\rho_{\xi} f_k\|_{\alpha,N} \le \sum_{(\beta,\gamma)\in\Omega_{\alpha}} \frac{\alpha!}{\beta!\gamma!} |\xi^{\beta}| \|f_k\|_{\gamma,N}$$
$$\to 0$$

Since  $\alpha, N \in \mathbb{N}_0$  are arbitrary,  $\rho_{\xi} f_k \to 0$ . So  $\rho_{\xi}$  is continuous at 0. Since  $\rho_{\xi}$  is linear,  $\rho_{\xi}$  is continuous.

#### 3.4 Dilation and Concentration Operators

**Definition 3.4.0.1.** Let  $\xi \in \mathbb{R}^n$ . We define the **dilation by** t **operator**, denoted  $\gamma_t : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$ , by  $\gamma_t f(x) = f(tx)$ .

**Exercise 3.4.0.2.** Let  $t \neq 0$ . Then  $\gamma_t : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $\lambda \in \mathbb{C}$ . Then for each  $x \in \mathbb{R}^n$ , we have that

$$\gamma_t(f + \lambda g)(x) = (f + \lambda g)(tx)$$

$$= f(tx) + \lambda g(tx)$$

$$= \gamma_t f(x) + \lambda \gamma_t g(x)$$

Since  $x \in \mathbb{R}^n$  is arbitrary, we have that  $\gamma_t(f + \lambda g) = \gamma_t f + \lambda \gamma_t g$ . Since  $f, g \in \mathcal{S}(\mathbb{R}^n)$  are arbitrary,  $\gamma_t$  is linear.

**Exercise 3.4.0.3.** Let  $t \neq 0$ . Then for each  $\alpha \in \mathbb{N}_0^n$ ,

$$\partial^{\alpha} \gamma_t = t^{|\alpha|} \gamma_t \partial^{\alpha}$$

Proof. Let  $\alpha \in \mathbb{N}_0^n$  and  $f \in \mathcal{S}(\mathbb{R}^n)$ . The chain rule implies that the claim is true if  $|\alpha| = 0$  or  $|\alpha| = 1$ . Let k > 1. Suppose the claim is true for  $|\alpha| = k - 1$  so that for each  $\beta \in \mathbb{N}_0$ ,  $|\beta| = k - 1$  implies that  $\partial^{\beta}(\gamma_t f) = t^{|\beta|} \gamma_t(\partial^{\beta} f)$ . Suppose that  $|\alpha| = k$ . Since k > 0, there exists  $j \in \{1, \ldots, n\}$  such that  $\alpha_j > 0$ . The chain rule implies that

$$(\partial^{\alpha} \gamma_{t}) f = \partial^{\alpha} (\gamma_{t} f)$$

$$= \partial_{j} (\partial^{\alpha - e_{j}} [\gamma_{t} f])$$

$$= \partial_{j} (t^{|\alpha - e_{j}|} \gamma_{t} [\partial^{\alpha - e_{j}} f])$$

$$= t^{|\alpha - e_{j}|} \partial_{j} (\gamma_{t} [\partial^{\alpha - e_{j}} f])$$

$$= t^{|\alpha - e_{j}|} t \gamma_{t} (\partial_{j} [\partial^{\alpha - e_{j}} f])$$

$$= t^{|\alpha|} \gamma_{t} (\partial^{\alpha} f)$$

$$= (t^{|\alpha|} \gamma_{t} \partial^{\alpha}) f$$

Since  $f \in \mathcal{S}(\mathbb{R}^n)$  is arbitrary,  $\partial^{\alpha} \gamma_t = t^{|\alpha|} \gamma_t \partial^{\alpha}$ . So the claim is true for  $|\alpha| = k$ . By induction the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Exercise 3.4.0.4.** Let  $y \in \mathbb{R}$  and  $t \neq 0$ . Then there exists C > 0 such that for each  $x \in \mathbb{R}^n$ ,  $1 + |x| \leq C(1 + |tx|)^2$ .

*Proof.* Choose  $C = \max(1/(2|t|), 1)$ . Let  $x \in \mathbb{R}^n$ . Then

$$C(1 + |tx|)^{2} - (1 + |x|) = C + 2C|tx| + C|tx|^{2} - 1 - |x|$$

$$= C + (2C|t| - 1)|x| + C|tx|^{2} - 1$$

$$= (C - 1) + (2C|t| - 1)|x| + C|tx|^{2}$$

$$> 0$$

So  $1 + |x| \le C(1 + |tx|)^2$ .

**Exercise 3.4.0.5.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $t \neq 0$ . Then  $\gamma_t f \in \mathcal{S}(\mathbb{R}^n)$  and there exists C > 0 such that for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$\|\gamma_t f\|_{\alpha,N} \le |t|^{|\alpha|} C^N \|f\|_{\alpha,2N}$$

*Proof.* The previous exercise implies that there exists C > 0 such that for each  $x \in \mathbb{R}^n$ ,  $1 + |x| \le C(1 + |tx|)^2$ . Let  $\alpha \in \mathbb{N}_0^n$ ,  $N \in \mathbb{N}_0$  and  $x \in \mathbb{R}^n$ . Then

$$(1+|x|)^{N}|\partial^{\alpha}(\gamma_{t}f)(x)| = (1+|x|)^{N}|t^{|\alpha|}(\gamma_{t}\partial^{\alpha}f)(x)|$$

$$\leq C(1+|tx|)^{2N}|t|^{|\alpha|}|(\gamma_{t}\partial^{\alpha}f)(x)|$$

$$= C(1+|tx|)^{2N}|t|^{|\alpha|}|\partial^{\alpha}f(tx)|$$

$$\leq C|t|^{|\alpha|}||f||_{\alpha,2N}$$

Since  $x \in \mathbb{R}^n$  is arbitrary, we have that

$$\|\gamma_t f\|_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1 + |x|)^N |\partial^{\alpha} (\gamma_t f)(x)| \right]$$

$$\leq Ct^{|\alpha|} \|f\|_{\alpha,2N}$$

$$< \infty$$

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $\gamma_t f \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.4.0.6.** Let  $t \neq 0$ . Then  $\gamma_t : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

*Proof.* Let  $(f_k)_{k\in\mathbb{N}}\subset\mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_k\to 0$ . Then for each  $\alpha,N\in\mathcal{N}_0$ ,  $\|f_k\|_{\alpha,N}\to 0$ . The previous exercise implies that there exists C>0 such that for each  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}_0$ ,

$$\|\gamma_t f\|_{\alpha,N} \le |t|^{|\alpha|} C^N \|f\|_{\alpha,2N}$$

Let  $\alpha, N \in \mathcal{N}_0$ . Then

$$\|\gamma_t f_k\|_{\alpha,N} \le C|t|^{|\alpha|} \|f\|_{\alpha,2N}$$

$$\to 0$$

Since  $\alpha, N \in \mathbb{N}_0$  are arbitrary,  $\gamma_t f_k \to 0$ . So  $\gamma_t$  is continuous at 0. Since  $\gamma_t$  is linear,  $\rho_{\xi}$  is continuous.

**Definition 3.4.0.7.** Let  $\xi \in \mathbb{R}^n$ . We define the **concentration by** t **operator**, denoted  $\kappa_t : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$ , by  $\kappa_t f(x) = t^{-1} \gamma_{t-1} f$ .

**Exercise 3.4.0.8.** Let  $t \neq 0$ . Then  $\kappa_t : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

*Proof.* Clear since  $\gamma_t : \mathcal{S}(\mathbb{R}^n) \to C^{\infty}(\mathbb{R}^n)$  is linear.

**Exercise 3.4.0.9.** Let  $t \neq 0$ . Then for each  $\alpha \in \mathbb{N}_0^n$ ,

$$\partial^{\alpha} \kappa_t = t^{-|\alpha|} \kappa_t \partial^{\alpha}$$

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$ . Then

$$\begin{split} \partial^{\alpha} \kappa_t &= \partial^{\alpha} t^{-1} \gamma_{t-1} \\ &= t^{-1} \partial^{\alpha} \gamma_{t-1} \\ &= t^{-1} (t^{-1})^{|\alpha|} \gamma_{t-1} \partial^{\alpha} \\ &= t^{-|\alpha|} \kappa_t \partial^{\alpha} \end{split}$$

**Exercise 3.4.0.10.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $t \neq 0$ . Then  $\kappa_t f \in \mathcal{S}(\mathbb{R}^n)$  and there exists C > 0 such that for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$\|\kappa_t f\|_{\alpha,N} \le |t|^{-(|\alpha|+1)} C^N \|f\|_{\alpha,2N}$$

*Proof.* A previous exercise implies that there exists C>0 such that for each  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}_0$ ,

$$\|\gamma_t f\|_{\alpha,N} \le |t|^{|\alpha|} C^N \|f\|_{\alpha,2N}$$

Let  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . Then

$$\|\kappa_{t}f\|_{\alpha,N} = \|t^{-1}\gamma_{t^{-1}}f\|_{\alpha,N}$$

$$= |t^{-1}|\|\gamma_{t^{-1}}f\|_{\alpha,N}$$

$$\leq |t^{-1}||t^{-1}|^{|\alpha|}C^{N}\|f\|_{\alpha,2N}$$

$$= |t|^{-(|\alpha|+1)}C^{N}\|f\|_{\alpha,2N}$$

$$< \infty$$

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $\kappa_t f \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.4.0.11.** Let  $t \neq 0$ . Then  $\kappa_t : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

*Proof.* Since  $\gamma_{t^{-1}}: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous,  $\kappa_t = t^{-1}\gamma_{t^{-1}}$  is continuous.

**Exercise 3.4.0.12.** need to show that  $t \mapsto \kappa_t f$  is continuous for each f, i.e.  $t \mapsto \kappa_t$  is continuous in strong operator topology

**Exercise 3.4.0.13.** Let  $t \neq 0$  and  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then

$$\int_{\mathbb{R}} \kappa_t f \, dm = \int_{\mathbb{R}} f \, dm$$

Proof. We have that

$$\int_{\mathbb{R}} \kappa_t f \, dm = \int_{\mathbb{R}} t^{-1} \gamma_{t-1} f \, dm$$
$$= \int_{\mathbb{R}} t^{-1} f(t^{-1} y) \, dm(y)$$
$$= \int_{\mathbb{R}} f(z) \, dm(z)$$

#### 3.5 The Convolution on $\mathcal{S}(\mathbb{R}^n)$

**Definition 3.5.0.1.** Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ . We define the **convolution of** f **and** g, denoted  $f * g : \mathbb{R}^n \to \mathbb{C}$  by

$$f * g(x) = \int_{\mathbb{R}^n} \tau_y f(x) g(y) \, dm(y)$$

**Exercise 3.5.0.2.** Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ . Then  $f * g \in C^{\infty}(\mathbb{R}^n)$  and for each  $\alpha \in \mathbb{N}_0^n$ 

$$\partial^{\alpha}(f * g) = (\partial^{\alpha} f) * g$$

Hint: exchange integration and differentiation

*Proof.* Let  $\alpha \in \mathbb{N}_0^n$ . We proceed by induction on  $|\alpha|$ .

• Suppose that  $|\alpha| = 0$ . Then  $\alpha = 0$ . Define  $h_0 \in C^{\infty}(\mathbb{R}^n \times \mathbb{R}^n)$  by  $h(x,y) = \tau_y f(x)g(y)$ . We observe that for each  $x, y \in \mathbb{R}^n$ ,

$$|h(x,y)| = |\tau_y f(x)||g(y)|$$

$$\leq ||\tau_y f||_{0,0}|g(y)|$$

$$\leq ||f||_{0,0}|g(y)|$$

Since  $||f||_{0,0}|g| \in L^1(\mathbb{R}^n)$  and for each  $y \in \mathbb{R}^n$ ,  $h(x,y) \to h(x_0,y)$  as  $x \to x_0$ , we have that

$$f * g = \int_{\mathbb{R}^n} \tau_y f(\cdot) g(y) \, dm(y)$$
$$= \int_{\mathbb{R}^n} h(\cdot, y) \, dm(y)$$

is continuous. Therefore,  $f * g \in C(\mathbb{R}^n)$  and  $\partial^{\alpha}(f * g) = (\partial^{\alpha} f) * g$ .

• Let k>0. Suppose that for each  $\beta\in\mathbb{N}_0^n$ ,  $|\beta|=k-1$  implies that  $f*g\in C^{|\beta|}(\mathbb{R}^n)$  and

$$\partial^{\beta}(f*g) = (\partial^{\beta}f)*g$$

Suppose that  $|\alpha| = k$ . Then there exists  $j \in \{1, ..., n\}$  such that  $\alpha_j > 0$ . Define  $h \in C^{\infty}(\mathbb{R}^n \times \mathbb{R}^n)$  by  $h(x, y) = \tau_y[\partial_x^{\alpha - e_j} f](x)g(y)$ . By hypothesis,

$$\begin{split} [\partial^{\alpha - e_j} (f * g)](x) &= [(\partial^{\alpha - e_j} f) * g](x) \\ &= \int_{\mathbb{R}^n} \tau_y [\partial_x^{\alpha - e_j} f](x) g(y) \, dm(y) \\ &= \int_{\mathbb{R}^n} h(x, y) \, dm(y) \end{split}$$

We observe that for each  $x, y \in \mathbb{R}^n$ ,

$$\begin{split} \partial_x^{e_j} h(x,y) &= \partial_x^{e_j} [\tau_y(\partial_x^{\alpha - e_j} f)](x) g(y) \\ &= \partial_x^{\alpha} [\tau_y f](x) g(y) \end{split}$$

which implies that

$$\begin{aligned} |\partial_x^{e_j} h(x, y)| &= |\partial_x^{\alpha} [\tau_y f](x) g(y)| \\ &\leq ||\tau_y f||_{\alpha, 0} |g(y)| \\ &\leq ||f||_{\alpha, 0} |g(y)| \end{aligned}$$

Since  $g \in L^1(\mathbb{R}^n)$ ,  $\partial^{e_j}[\partial^{\alpha-e_j}(f*g)]$  exists and we may exchange the order of integration and differentiation to obtain that

$$\begin{split} [\partial_x^\alpha (f*g)](x) &= \partial_x^{e_j} [\partial_x^{\alpha - e_j} (f*g)](x) \\ &= \partial_x^{e_j} \int_{\mathbb{R}^n} h(x,y) \, dm(y) \\ &= \int_{\mathbb{R}^n} \partial_x^{e_j} h(x,y) \, dm(y) \\ &= \int_{\mathbb{R}^n} \partial_x^{e_j} [\tau_y (\partial_x^{\alpha - e_j} f)](x) g(y) \, dm(y) \\ &= \int_{\mathbb{R}^n} \tau_y [\partial_x^\alpha f](x) g(y) \, dm(y) \\ &= [(\partial_x^\alpha f) * g](x) \end{split}$$

So  $f * g \in C^{|\alpha|}(\mathbb{R}^n)$  and  $\partial^{\alpha}(f * g) = (\partial^{\alpha}f) * g$ .

• By induction, for each  $\alpha \in \mathbb{N}_0$ ,  $f * g \in C^{|\alpha|}(\mathbb{R}^n)$  and  $\partial^{\alpha}(f * g) = (\partial^{\alpha}f) * g$ .

Since for each  $\alpha \in \mathbb{N}_0^n$ ,  $f * g \in C^{|\alpha|}(\mathbb{R}^n)$ , we have that  $f * g \in C^{\infty}(\mathbb{R}^n)$ .

**Exercise 3.5.0.3.** Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ , then  $f * g \in \mathcal{S}(\mathbb{R}^n)$  and there exists C > 0 such that for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$||f * g||_{\alpha,N} \le C||f||_{\alpha,N}||g||_{0,N+2}$$

Proof. Set

$$C = \int_{\mathbb{R}} \frac{1}{(1+|y|)^2} \, dm(y)$$

Let  $\alpha \in \mathbb{N}_0^n$ ,  $N \in \mathbb{N}_0$  and  $x \in \mathbb{R}$ . Then

$$(1+|x|)^{N}|\partial^{\alpha}(f*g)(x)| = (1+|x|)^{N}|(\partial^{\alpha}f)*g(x)|$$

$$= (1+|x|)^{N}\left|\int_{\mathbb{R}} \tau_{y}[\partial_{x}^{\alpha}f](x)g(y) dm(y)\right|$$

$$= \left|\int_{\mathbb{R}} (1+|x|)^{N}\partial_{x}^{\alpha}[\tau_{y}f](x)g(y) dm(y)\right|$$

$$\leq \int_{\mathbb{R}} (1+|x|)^{N}|\partial_{x}^{\alpha}[\tau_{y}f](x)||g(y)| dm(y)$$

$$\leq \int_{\mathbb{R}} ||\tau_{y}f||_{\alpha,N}|g(y)| dm(y)$$

$$\leq \int_{\mathbb{R}} (1+|y|)^{N}||f||_{\alpha,N}|g(y)| dm(y)$$

$$= ||f||_{\alpha,N} \int_{\mathbb{R}} (1+|y|)^{N+2}|g(y)|(1+|y|)^{-2} dm(y)$$

$$\leq ||f||_{\alpha,N} \int_{\mathbb{R}} ||g||_{0,N+2} (1+|y|)^{-2} dm(y)$$

$$= ||f||_{\alpha,N} ||g||_{0,N+2} \int_{\mathbb{R}} (1+|y|)^{-2} dm(y)$$

$$= C||f||_{\alpha,N} ||g||_{0,N+2}$$

Since  $x \in \mathbb{R}$  is arbitrary, we have that

$$||f * g||_{\alpha,N} = \sup_{x \in \mathbb{R}} \left[ (1 + |x|)^N |\partial^{\alpha} (f * g)(x)| \right]$$
  
$$\leq C||f||_{\alpha,N} ||g||_{0,N+2}$$
  
$$< \infty$$

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary, we have that  $f * g \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.5.0.4.** The convolution  $*: \mathcal{S}(\mathbb{R}^n) \times \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is bilinear.

*Proof.* Let  $f, g, h \in \mathcal{S}(\mathbb{R}^n)$ ,  $\lambda \in \mathbb{C}$  and  $x \in \mathbb{R}^n$ . Since  $\tau_y : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is linear, we have that

$$[(f+\lambda g)*h](x) = \int_{\mathbb{R}^n} \tau_y [f+\lambda g](x)h(y) \, dm(y)$$

$$= \int_{\mathbb{R}^n} \left(\tau_y [f](x) + \lambda \tau_y [g](x)\right) h(y) \, dm(y)$$

$$= \int_{\mathbb{R}^n} \tau_y [f](x)h(y) \, dm(y) + \lambda \int_{\mathbb{R}^n} \tau_y [g](x)h(y) \, dm(y)$$

$$= [f*h](x) + [\lambda g*h](x)$$

Since  $x \in \mathbb{R}^n$  is arbitrary,  $(f + \lambda g) * h = f * h + \lambda g * h$ . Similarly,  $f * (g + \lambda h) = f * g + \lambda f * h$ .

**Exercise 3.5.0.5.** The convolution  $*: \mathcal{S}(\mathbb{R}^n) \times \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is commutative.

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$  and  $x \in \mathbb{R}^n$ . Then

$$f * g(x) = \int_{\mathbb{R}} f(x - y)g(y) dm(y)$$
$$= \int_{\mathbb{R}} f(z)g(x - z) dm(z)$$
$$= \int_{\mathbb{R}} g(x - z)f(z) dm(z)$$
$$= g * f(x)$$

Since  $x \in \mathbb{R}^n$  is arbitrary, f \* g = g \* f.

**Exercise 3.5.0.6.** The convolution  $*: \mathcal{S}(\mathbb{R}^n) \times \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

Proof. Let  $(f_n, g_n)_{n \in \mathbb{N}} \subset \mathcal{S}(\mathbb{R}^n) \times \mathcal{S}(\mathbb{R}^n)$  and  $(f, g) \in \mathcal{S}(\mathbb{R}^n) \times \mathcal{S}(\mathbb{R}^n)$ . Suppose that  $(f_n, g_n) \to (f, g)$ . Then  $f_n \to f$  and  $g_n \to g$ . Hence for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,  $||f_n - f||_{\alpha, N} \to 0$  and  $||g_n - g||_{\alpha, N} \to 0$ . In particular

$$\left| \|g_n\|_{0,N+2} - \|g\|_{0,N+2} \right| \le \|g_n - g\|_{0,N+2}$$

So that  $(\|g_n\|_{0,N+2})_{n\in\mathbb{N}}$  is bounded. Let  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}_0$ . Define C>0 as in the previous exercise. Then

$$||f_n * g_n - f * g||_{\alpha,N} = ||f_n * g_n - f * g_n + f * g_n - f * g||_{\alpha,N}$$

$$\leq ||(f_n - f) * g_n||_{\alpha,N} + ||f_*(g_n - g)||_{\alpha,N}$$

$$\leq C||f_n - f||_{\alpha,N}||g_n||_{0,N+2} + C||f||_{\alpha,N}||g_n - g||_{0,N+2}$$

$$\to 0$$

Since  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$  are arbitrary,  $f_n * g_n \to f * g$ . Thus  $*: \mathcal{S}(\mathbb{R}^n) \times \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

**Exercise 3.5.0.7.** Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ . Then  $||f * g||_1 \le ||f||_1 ||g||_1$ .

*Proof.* Tonelli's theorem implies that

$$||f * g||_{1} = \int_{\mathbb{R}} |f * g(x)| dm(x)$$

$$= \int_{\mathbb{R}} \left| \int_{\mathbb{R}} f(x - y)g(y) dm(y) \right| dm(x)$$

$$\leq \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x - y)g(y)| dm(y) \right] dm(x)$$

$$= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x - y)g(y)| dm(x) \right] dm(y)$$

$$= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x - y)| dm(x) \right] |g(y)| dm(y)$$

$$= ||f||_{1} \int_{\mathbb{R}} |g(y)| dm(y)$$

$$= ||f||_{1} ||g||_{1}$$

**Definition 3.5.0.8.** We define the **bump functions** on  $\mathbb{R}$ , denoted  $C_c^{\infty}(\mathbb{R})$ , by

$$C_c^{\infty}(\mathbb{R}) = C_c(\mathbb{R}) \cap C^{\infty}(\mathbb{R})$$

**Exercise 3.5.0.9.** Let  $f \in C_c^{\infty}(\mathbb{R})$ . Then  $f \in \mathcal{S}(\mathbb{R}^n)$ .

*Proof.* Let  $\alpha, N \in \mathbb{N}^0$ . Define  $g: \mathbb{R}^n \to \mathbb{C}$  by

$$g(x) = (1 + |x|)^N |\partial^{\alpha} f(x)|$$

Then g is continuous. Since  $\operatorname{supp}(\partial^{\alpha} f) \subset \operatorname{supp}(f)$ , we have that  $g \in C_c(\mathbb{R})$  and

$$\sup_{x \in \mathbb{R}} \left[ (1 + |x|)^N |\partial^{\alpha} f| \right] = \sup_{x \in \mathbb{R}} g(x)$$
$$= ||g||$$
$$< \infty$$

**Exercise 3.5.0.10.** Define  $f: \mathbb{R}^n \to \mathbb{R}$  by  $f(x) = e^{-x^2}$ . Then  $f \in \mathcal{S}(\mathbb{R}^n)$ .

Proof. meh...

**Exercise 3.5.0.11.** Define  $f: \mathbb{R}^n \to \mathbb{R}$  by

$$f(x) = \begin{cases} e^{-\frac{1}{1-x^2}} & x \in (-1,1) \\ 0 & x \notin (-1,1) \end{cases}$$

Then  $f \in \mathcal{S}(\mathbb{R}^n)$ .

Proof. meh...

**Exercise 3.5.0.12.** Let  $a, b \in \mathbb{R}$ . Suppose that a < b. Then for each  $\epsilon > 0$ , there exists  $f \in \mathcal{S}(\mathbb{R}^n)$  such that  $\chi_{[a,b]} \leq f \leq \chi_{[a-\epsilon,b+\epsilon]}$ .

Proof. Set  $f(x) = \Box$ 

**Exercise 3.5.0.13.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Define

### 3.6 The Fourier Transform on $\mathcal{S}(\mathbb{R}^n)$

**Exercise 3.6.0.1.** Let  $\phi: \mathbb{R} \to S^1$  be a measurable homomorphism.

1. Then  $\phi \in L^1_{loc}(\mathbb{R})$  and there exists a > 0 such that

$$\int_{(0,a]} \phi dm \neq 0$$

2. Define

$$c = \left[ \int_{(0,a]} \phi dm \right]^{-1}$$

Then For each  $x \in \mathbb{R}$ ,

$$\phi(x) = c \int_{(x,x+a]} \phi dm$$

- 3.  $\phi \in C^{\infty}(\mathbb{R})$  and  $\phi' = c(\phi(a) 1)\phi$
- 4. Define  $b = c(\phi(a) 1)$  and  $g \in C^{\infty}(\mathbb{R})$  by  $g(x) = e^{-bx}\phi(x)$ . Then g is constant and there exists  $\xi \in \mathbb{R}$  such that for each  $x \in \mathbb{R}$ ,  $\phi(x) = e^{2\pi i \xi x}$ .

Proof.

1. Let  $K \subset \mathbb{R}$  be compact. Then

$$\int_{K} |\phi| dm = m(K) < \infty$$

So  $\phi \in L^1_{loc}(\mathbb{R})$ . For the sake of contradiction, suppose that for each a > 0,

$$\int_{(0,a]} \phi dm = 0$$

Then the FTC implies that  $\phi = 0$  a.e. on  $[0, \infty)$ , which is a contradiction. So there exists a > 0 such that

$$\int_{(0,a]} \phi dm \neq 0$$

2. For  $x \in \mathbb{R}$ ,

$$\phi(x) = c \int_{(0,a]} \phi(x)\phi(t)dm(t)$$
$$= c \int_{(0,a]} \phi(x+t)dm(t)$$
$$= c \int_{(x,x+a]} \phi dm$$

3. Part (2) and the FTC imply that  $\phi$  is continuous. Let  $d \in \mathbb{R}$ . Define  $f_d \in C((d, \infty))$  by

$$f_d(x) = \int_{(d,x]} \phi dm$$

Since  $\phi$  is continuous, the FTC implies that  $f_d$  is differentiable and for each x > d  $f'_d(x) = \phi(x)$ . Part (2) implies that for each x > d,

$$\phi(x) = c \int_{(x,x+a]} \phi dm$$
$$= c(f_d(x+a) - f_d(x))$$

So for each x > d,  $\phi$  is differentiable at x and

$$\phi'(x) = c(\phi(x+a) - \phi(x))$$
$$= c(\phi(a) - 1)\phi(x)$$

Since  $d \in \mathbb{R}$  is arbitrary,  $\phi$  is differentiable and  $\phi' = c(\phi(a) - 1)\phi$ . This implies that  $\phi \in C^{\infty}(\mathbb{R})$ .

4. Let  $x \in \mathbb{R}$ . Then

$$g'(x) = e^{-bx}\phi'(x) - be^{-bx}\phi(x)$$
$$= be^{-bx}\phi(x) - be^{-bx}\phi(x)$$
$$= 0$$

So g'=0 and g is constant. Hence there exists  $k \in \mathbb{R}$  such that for each  $x \in \mathbb{R}$ ,  $\phi(x)=ke^{bx}$ . Since  $\phi(0)=1, k=1$ . Since  $|\phi|=1$ , there exists  $\xi \in \mathbb{R}$  such that  $b=2\pi i \xi$ .

**Note 3.6.0.2.** To summarize, for each measurable homomorphism  $\phi : \mathbb{R} \to S^1$ , there exists  $\xi \in \mathbb{R}$  such such that for each  $x \in \mathbb{R}$ ,  $\phi(x) = e^{2\pi i \xi x}$ .

**Exercise 3.6.0.3.** Let  $\phi: \mathbb{R}^n \to S^1$  be a measurable homomorphism. Then there exists  $\xi \in \mathbb{R}^n$  such such that for each  $x \in \mathbb{R}$ ,  $\phi(x) = e^{2\pi i \langle \xi, x \rangle}$ .

**Definition 3.6.0.4.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . We define the **Fourier transform of** f, denoted  $\hat{f} : \mathbb{R}^n \to \mathbb{C}$ , by

$$\hat{f}(\xi) = \int_{\mathbb{R}} \rho_{\xi} f \, dm$$

**Exercise 3.6.0.5.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then  $\hat{f} \in C_b(\mathbb{R}^n)$ .

*Proof.* Since  $f \in \mathcal{S}(\mathbb{R}^n)$ ,  $f \in L^1(\mathbb{R}^n)$ . Then for each  $\xi \in \mathbb{R}$ ,

$$|\hat{f}(\xi)| = \left| \int_{\mathbb{R}} \rho_{\xi} f \, dm \right|$$

$$\leq \int_{\mathbb{R}} |\rho_{\xi} f| \, dm$$

$$= \int_{\mathbb{R}} |e^{-i\langle \xi, x \rangle} f(x)| \, dm(x)$$

$$= \int_{\mathbb{R}} |f(x)| \, dm(x)$$

$$= ||f||_{1}$$

So f is bounded. Let  $(\xi_n)_{n\in\mathbb{N}}\subset\mathbb{R}$  and  $\xi\in\mathbb{R}$ . Suppose that  $\xi_n\to\xi$ . Define  $(\phi_n)_{n\in\mathbb{N}}\subset L^1(\mathbb{R}^n)$  and  $\phi\in L^1(\mathbb{R}^n)$  by  $\phi_n(x)=\rho_{\xi_n}f(x)$  and  $\phi(x)=\rho_{\xi}f(x)$ . Then  $\phi_n\xrightarrow{\mathrm{p.w.}}\phi$  and for each  $n\in\mathbb{N}$ ,

$$|\phi_n| = |f|$$

$$\in L^1(\mathbb{R}^n)$$

The dominated convergence theorem implies that

$$\hat{f}(\xi_n) = \int_{\mathbb{R}} \phi_n \, dm$$

$$\to \int_{\mathbb{R}} \phi \, dm$$

$$= \hat{f}(\xi)$$

So  $\hat{f}$  is continuous. Hence  $\hat{f} \in C_b(\mathbb{R})$ .

**Definition 3.6.0.6.** We define the Fourier transform on  $\mathcal{S}(\mathbb{R}^n)$ , denoted  $\mathcal{F}: \mathcal{S}(\mathbb{R}^n) \to C_b(\mathbb{R}^n)$ , by

$$\mathcal{F}(f) = \hat{f}$$

**Exercise 3.6.0.7.** We have that  $\mathcal{F}: \mathcal{S}(\mathbb{R}^n) \to C_b(\mathbb{R}^n)$  is linear.

*Proof.* Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ ,  $\lambda \in \mathbb{C}$  and  $\xi \in \mathbb{R}^n$ . Since  $\rho_{\xi} : \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is linear, we have that

$$\mathcal{F}(f+\lambda g)(\xi) = \int_{\mathbb{R}} \rho_{\xi}(f+\lambda g) \, dm$$

$$= \int_{\mathbb{R}} \rho_{\xi}f + \lambda \rho_{\xi}g \, dm$$

$$= \int_{\mathbb{R}} \rho_{\xi}f \, dm + \lambda \int_{\mathbb{R}} \rho_{\xi}g \, dm$$

$$= \mathcal{F}(f)(\xi) + \lambda \mathcal{F}(g)(\xi)$$

**Exercise 3.6.0.8.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $\alpha \in \mathbb{N}_0^n$ . Then

1.  $\mathcal{F}(X^{\alpha}f) = (-1)^{|\alpha|} P^{\alpha} \mathcal{F}(f)$ 

2.  $\mathcal{F}(P^{\alpha}f) = X^{\alpha}\mathcal{F}(f)$ 

Proof.

1. Let  $\alpha \in \mathbb{N}_0^n$ . The claim is true if  $|\alpha| = 0$ . Let k > 0. Suppose that the claim is true for  $|\alpha| = k - 1$  so that for each  $\beta \in \mathbb{N}_0^n$ ,  $|\beta| = k - 1$  implies that  $\mathcal{F}(X^{\beta}f) = (-1)^{|\beta|}P^{\beta}\mathcal{F}(f)$ . Suppose that  $|\alpha| = k$ . Since k > 0, there exists  $j \in \{1, \ldots, n\}$  such that  $\alpha_j > 0$ . Define  $\phi : \mathbb{R}^n \times \mathbb{R}^n \to \mathbb{R}$  by  $\phi(\xi, x) = \rho_{\xi}X^{\alpha - e_j}f(x)$ . Then for each  $\xi, x \in \mathbb{R}$ ,

$$\partial_{\xi}^{e_j} \phi(\xi, x) = -ix^{e_j} \phi(x)$$
$$= -i\rho_{\xi} X^{\alpha} f(x)$$

Hence for each  $x, \xi \in \mathbb{R}^n$ ,

$$|\partial_{\xi}^{e_j} \phi(\xi, x)| = |-i\rho_{\xi} X^{\alpha} f(x)|$$
$$= |X^{\alpha} f(x)|$$

Since  $X^{\alpha} f \in \mathcal{S}(\mathbb{R}^n) \subset L^1$ , we may exchange the order of integration and differentiation to obtain that

$$\mathcal{F}(X^{\alpha}f)(\xi) = \int_{\mathbb{R}} \rho_{\xi} X^{\alpha} f(x) dm(x)$$

$$= \int_{\mathbb{R}^{n}} i\partial_{\xi}^{e_{j}} \phi(\xi, x) dm(x)$$

$$= i\partial^{e_{j}} \int_{\mathbb{R}} e^{-i\xi x} x^{\alpha - e_{j}} f(x) dm(x)$$

$$= -P^{e_{j}} \mathcal{F}(X^{\alpha - e_{j}} f)(\xi)$$

$$= -P^{e_{j}} \left[ (-1)^{|\alpha|-1} P^{\alpha - e_{j}} \mathcal{F}(f) \right](\xi)$$

$$= (-1)^{|\alpha|} P^{\alpha} \mathcal{F}(f)(\xi)$$

So the claim is true for  $\alpha$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

2. Let  $\alpha \in \mathbb{N}_0^n$ . The claim is true if  $|\alpha| = 0$ . Let k > 0. Suppose that the claim is true for  $|\alpha| = k - 1$  so that for each  $\beta \in \mathbb{N}_0^n$ ,  $|\beta| = k - 1$  implies that  $\mathcal{F}(P^{\beta}f) = X^{\beta}\mathcal{F}(f)$ . Suppose that  $|\alpha| = k$ . Since k > 0, there exists  $j \in \{1, \ldots, n\}$  such that  $\alpha_j > 0$ . Then integration by parts yields

$$\mathcal{F}(P^{\alpha}f)(\xi) = \int_{\mathbb{R}} e^{-i\langle \xi, x \rangle} [-i\partial_x P^{\alpha - e_j} f(x)] \, dm(x)$$

$$= -\int_{\mathbb{R}} -i\xi^{e_j} e^{-i\langle \xi, x \rangle} [-iP^{\alpha - e_j} f(x)] \, dm(x)$$

$$= \xi^{e_j} \int_{\mathbb{R}} e^{-i\langle \xi, x \rangle} P^{\alpha - e_j} f(x) \, dm(x)$$

$$= X^{e_j} \mathcal{F}(P^{\alpha - e_j} f)(\xi)$$

$$= X^{e_j} \left[ X^{\alpha - e_j} \mathcal{F}(f) \right](\xi)$$

$$= X^{\alpha} \mathcal{F}(f)(\xi)$$

So the claim is true for  $\alpha$ . By induction, the claim is true for each  $\alpha \in \mathbb{N}_0^n$ .

**Exercise 3.6.0.9.** There exists C > 0 such that for each  $f \in \mathcal{S}(\mathbb{R}^n)$ ,  $\|\hat{f}\|_{0,0} \leq C\|f\|_{0,2}$ .

Hint: Set

$$C = \int_{\mathbb{R}} \frac{1}{(1+|x|)^2} \, dm(x)$$

Proof. Set

$$C = \int_{\mathbb{P}} \frac{1}{(1+|x|)^2} \, dm(x)$$

Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Let  $\xi \in \mathbb{R}$ . Then

$$|\hat{f}(\xi)| = \left| \int_{\mathbb{R}} \rho_{\xi} f(x) \, dm(x) \right|$$

$$\leq \int_{\mathbb{R}} |f(x)| \, dm(x)$$

$$= \int_{\mathbb{R}} \frac{(1+|x|)^{2} |f(x)|}{(1+|x|)^{2}} \, dm(x)$$

$$\leq ||f||_{0,2} \int_{\mathbb{R}} \frac{1}{(1+|x|)^{2}} \, dm(x)$$

$$= C||f||_{0,2}$$

Since  $\xi \in \mathbb{R}$  is arbitrary,  $\|\hat{f}\|_{0,0} \leq C \|f\|_{0,2}$ .

**Exercise 3.6.0.10.** Let  $a, b \in \mathbb{R}$  and  $N \in \mathbb{N}_0$ . Then  $(a+b)^N \leq 2^{N-1}(a^N+b^N)$ .

**Hint:** Jensen's inequality

Proof. Jensen's inequality implies that

$$2^{-N}(a+b)^N = \left(\frac{a}{2} + \frac{b}{2}\right)^N$$
$$\leq \left(\frac{a^N}{2} + \frac{b^N}{2}\right)$$
$$= 2^{-1}(a^N + b^N)$$

So 
$$(a+b)^N \le 2^{N-1}(a^N + b^N)$$
.

**Exercise 3.6.0.11.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then  $\mathcal{F}(f) \in \mathcal{S}(\mathbb{R}^n)$  and there exists C > 0 such that for each  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ ,

$$\|\mathcal{F}(f)\|_{\alpha,N} \le C2^{N-1} \|X^{\alpha}f\|_{0,2} + C2^{N-1} \|P^N X^{\alpha}f\|_{0,2}$$

*Proof.* Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $\alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . Then the previous exercise implies that for each  $\xi \in \mathbb{R}$ ,

$$\xi^{N} \partial^{\alpha} \mathcal{F}(f)(\xi) = (-i)^{N} X^{N} P^{\alpha} \mathcal{F}(f)(\xi)$$
$$= i^{N} X^{N} \mathcal{F}(X^{\alpha} f)(\xi)$$
$$= i^{N} \mathcal{F}(P^{N} X^{\alpha} f)(\xi)$$

Set

$$C = \int_{\mathbb{R}} \frac{1}{(1+|x|)^2} \, dm(x)$$

as in the previous exercise. Since  $\mathcal{F}(X^{\alpha}f)$ ,  $\mathcal{F}(P^{N}X^{\alpha}f) \in C_{b}(\mathbb{R})$ , we have that

$$\begin{split} \|\mathcal{F}(f)\|_{\alpha,N} &= \sup_{\xi \in \mathbb{R}} \left[ (1 + |\xi|)^N |\partial^{\alpha} \mathcal{F}(f)(\xi)| \right] \\ &\leq \sup_{\xi \in \mathbb{R}} \left[ 2^{N-1} (1 + |\xi|^N) |\partial^{\alpha} \mathcal{F}(f)(\xi)| \right] \\ &= \sup_{\xi \in \mathbb{R}} \left[ |2^{N-1} \partial^{\alpha} \mathcal{F}(f)(\xi)| + |2^{N-1} \xi^N \partial^{\alpha} \mathcal{F}(f)(\xi)| \right] \\ &= \sup_{\xi \in \mathbb{R}} \left[ |\mathcal{F}(2^{N-1} X^{\alpha} f)(\xi)| + |\mathcal{F}(2^{N-1} P^N X^{\alpha} f)(\xi)| \right] \\ &\leq \|\mathcal{F}(2^{N-1} X^{\alpha} f)\|_{0,0} + \|\mathcal{F}(2^{N-1} P^N X^{\alpha} f)\|_{0,0} \\ &\leq C 2^{N-1} \|X^{\alpha} f\|_{0,2} + C 2^{N-1} \|P^N X^{\alpha} f\|_{0,2} \\ &< \infty \end{split}$$

Since  $\alpha, N \in \mathbb{N}_0$  are arbitrary,  $\mathcal{F}(f) \in \mathcal{S}(\mathbb{R}^n)$ .

**Exercise 3.6.0.12.** We have that  $\mathcal{F}: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

Proof. Let  $(f_n)_{n\in\mathbb{N}}\subset \mathcal{S}(\mathbb{R}^n)$ . Suppose that  $f_n\to 0$ . Since  $X,P:\mathcal{S}(\mathbb{R}^n)\to \mathcal{S}(\mathbb{R}^n)$  are continuous,  $X^{\alpha}f_n\to 0$  and  $P^NX^{\alpha}f_n\to 0$ . Therefore,  $\|X^{\alpha}f_n\|_{0,2}\to 0$  and  $\|P^NX^{\alpha}f_n\|_{0,2}\to 0$ . The previous exercise implies there exists C>0 such that for each  $\alpha\in\mathbb{N}_0^n$  and  $N\in\mathbb{N}_0$ ,

$$\|\mathcal{F}(f_n)\|_{\alpha,N} \le C2^{N-1} \|X^{\alpha} f_n\|_{0,2} + C2^{N-1} \|P^N X^{\alpha} f_n\|_{0,2}$$

$$\to 0$$

Hence  $\mathcal{F}(f_n) \to 0$  and  $\mathcal{F}$  is continuous at 0. Since  $\mathcal{F}$  is linear,  $\mathcal{F}: \mathcal{S}(\mathbb{R}^n) \to \mathcal{S}(\mathbb{R}^n)$  is continuous.

**Exercise 3.6.0.13.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$ . Then

- 1. for each  $y \in \mathbb{R}$ ,  $\mathcal{F}(\tau_u f) = \rho_u \mathcal{F}(f)$
- 2. for each  $\eta \in \mathbb{R}$ ,  $\mathcal{F}(\rho_n f) = \tau_{-n} \mathcal{F}(f)$
- 3.  $\mathcal{F}(\gamma_t f) = \kappa_t \mathcal{F}(f)$

Proof.

1. Let  $y, \xi \in \mathbb{R}$ . Then

$$\mathcal{F}(\tau_y f)(\xi) = \int_{\mathbb{R}} e^{-i\xi x} f(x - y) \, dm(x)$$

$$= \int_{\mathbb{R}} e^{-i\xi(z+y)} f(z) \, dm(z)$$

$$= e^{-i\xi y} \int_{\mathbb{R}} e^{-i\xi z} f(z) \, dm(z)$$

$$= e^{-i\xi y} \mathcal{F}(f)(\xi)$$

$$= \rho_y \mathcal{F}(f)(\xi)$$

2. Let  $\eta, \xi \in \mathbb{R}$ . Then

$$\mathcal{F}(\rho_{\eta}f)(\xi) = \int_{\mathbb{R}} e^{-i\xi x} e^{-i\eta x} f(x) \, dm(x)$$
$$= \int_{\mathbb{R}} e^{-i(\xi + \eta)x} f(x) \, dm(x)$$
$$= \mathcal{F}(f)(\xi + \eta)$$
$$= \tau_{-\eta} \mathcal{F}(f)(\xi)$$

3. Let  $\xi \in \mathbb{R}$ . Then

$$\mathcal{F}(\gamma_t f)(\xi) = \int_{\mathbb{R}} e^{-i\xi x} f(tx) \, dm(x)$$

$$= \int_{\mathbb{R}} e^{-i\xi t^{-1} z} f(z) t^{-1} \, dm(z)$$

$$= t^{-1} \mathcal{F}(f)(t^{-1} \xi)$$

$$= t^{-1} \gamma_{t-1} \mathcal{F}(f)(\xi)$$

**Exercise 3.6.0.14.** Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ . Then  $\mathcal{F}(f * g) = \mathcal{F}(f)\mathcal{F}(g)$ .

*Proof.* Let  $\xi \in \mathbb{R}$ . Tonelli's theorem implies that

$$\begin{split} \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |e^{-i\xi x} f(x-y) g(y)| \, dm(y) \right] dm(x) &= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x-y) g(y)| \, dm(y) \right] dm(x) \\ &= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x-y) g(y)| \, dm(x) \right] dm(y) \\ &= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x-y)| \, dm(x) \right] |g(y)| \, dm(y) \\ &= \|f\|_1 \int_{\mathbb{R}} |g(y)| \, dm(y) \\ &= \|f\|_1 \|g\|_1 \end{split}$$

So we may apply Fubini's theorem and change the order of integration to obtain that

$$\mathcal{F}(f * g)(\xi) = \int_{\mathbb{R}} e^{-i\xi x} (f * g)(x) \, dm(x)$$

$$= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} e^{-i\xi x} f(x - y) g(y) \, dm(y) \right] dm(x)$$

$$= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} e^{-i\xi x} f(x - y) g(y) \, dm(x) \right] dm(y)$$

$$= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} e^{-i\xi x} f(x - y) \, dm(x) \right] g(y) \, dm(y)$$

$$= \int_{\mathbb{R}} [\mathcal{F}(\tau_y f)(\xi)] g(y) \, dm(y)$$

$$= \int_{\mathbb{R}} [e^{-i\xi y} \mathcal{F}(f)(\xi)] g(y) \, dm(y)$$

$$= \mathcal{F}(f)(\xi) \int_{\mathbb{R}} e^{-i\xi y} g(y) \, dm(y)$$

$$= \mathcal{F}(f)(\xi) \mathcal{F}(g)(\xi)$$

Since  $\xi \in \mathbb{R}$  is arbitrary,  $\mathcal{F}(f * g) = \mathcal{F}(f)\mathcal{F}(g)$ 

**Exercise 3.6.0.15.** Let  $f, g \in \mathcal{S}(\mathbb{R}^n)$ . Then

$$\int_{\mathbb{R}} \hat{f}g \, dm = \int_{\mathbb{R}} f \hat{g} \, dm$$

*Proof.* Tonelli's theorem implies that

$$\int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |e^{-i\xi x} f(x) g(\xi)| \, dm(x) \right] dm(\xi) = \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |f(x)| \, dm(x) \right] |g(\xi)| \, dm(\xi)$$

$$= \|f\|_1 \int_{\mathbb{R}} |g(\xi)| \, dm(\xi)$$

$$= \|f\|_1 \|g\|_1$$

So we may apply Fubini's theorem and switch the order of integration to obtain that

$$\begin{split} \int_{\mathbb{R}} \hat{f}g \, dm &= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} e^{-i\xi x} f(x) \, dm(x) \right] g(\xi) \, dm(\xi) \\ &= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} e^{-i\xi x} f(x) g(\xi) \, dm(x) \right] dm(\xi) \\ &= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} e^{-i\xi x} f(x) g(\xi) \, dm(\xi) \right] dm(x) \\ &= \int_{\mathbb{R}} f(x) \left[ \int_{\mathbb{R}} e^{-i\xi x} g(\xi) \, dm(\xi) \right] dm(x) \\ &= \int_{\mathbb{R}} f(x) \hat{g}(x) \, dm(x) \\ &= \int_{\mathbb{R}} f \hat{g} \, dm \end{split}$$

**Exercise 3.6.0.16.** Define  $f \in \mathcal{S}(\mathbb{R}^n)$  by  $f(x) = e^{-x^2/2}$ . Then  $\mathcal{F}(f) = \sqrt{2\pi}f$ .

*Proof.* Note that for each  $\xi \in \mathbb{R}$ ,

$$\mathcal{F}(Df)(\xi) = \int_{\mathbb{R}} e^{-i\xi x} ix e^{-x^2/2} dm(x)$$
$$= -\int_{\mathbb{R}} \partial_{\xi} \left[ e^{-i\xi x} e^{-x^2/2} \right] dm(x)$$
$$= -\partial_{\xi} \mathcal{F}(f)(\xi)$$

A previous exercise implies that  $\mathcal{F}(Df) = X\mathcal{F}(f)$ . So for each  $\xi \in \mathbb{R}$ ,  $\partial_{\xi} \hat{f}(\xi) = -\xi \hat{f}(\xi)$ . Define  $g \in \mathbb{C}^{\infty}(\mathbb{R})$  by  $g(\xi) = e^{\xi^2/2}$ .

$$\partial_{\xi}(\hat{f}g) = (\partial_{\xi}\hat{f})g + \hat{f}(\partial_{\xi}g)$$
$$= 0$$

So there exists  $C \in \mathbb{R}$  such that  $\hat{f}g = C$ . Hence for each  $\xi \in \mathbb{R}$ ,

$$\hat{f}(\xi) = Ce^{-\xi^2/2}$$
$$= Cf(\xi)$$

Therefore,

$$C = Cf(0)$$

$$= \hat{f}(0)$$

$$= \int_{\mathbb{R}} e^{-x^2/2} dm(x)$$

$$= \sqrt{2\pi}$$

So  $\hat{f} = \sqrt{2\pi} f$ .

**Definition 3.6.0.17.** Let  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $t \neq 0$ . We define  $f_t \in \mathcal{S}(\mathbb{R}^n)$  by  $f_t = t^{-1}\gamma_{t-1}f$ .

**Exercise 3.6.0.18.** Let  $\phi \in \mathcal{S}(\mathbb{R}^n)$  and  $t \neq 0$ . Then

$$\int_{\mathbb{R}} \phi_t \, dm = \int_{\mathbb{R}} \phi \, dm$$

get rid of and cite previous exercise

*Proof.* We have that

$$\int_{\mathbb{R}} \phi_t \, dm = \int_{\mathbb{R}} t^{-1} \phi(t^{-1}x) \, dm(x)$$
$$= \int_{\mathbb{R}} \phi(z) \, dm(z)$$
$$= \int_{\mathbb{R}} \phi \, dm$$

**Exercise 3.6.0.19.** Let  $\phi \in \mathcal{S}(\mathbb{R}^n)$ . Set

$$\alpha = \int_{\mathbb{R}} \phi \, dm$$

Then for each  $f \in \mathcal{S}(\mathbb{R}^n)$ ,  $f * \phi_{1/n} \xrightarrow{L^1} \alpha f$ . **Hint:** for each  $t \neq 0$  and  $x \in \mathbb{R}$ ,

$$f * \phi_t(x) - \alpha f(x) = \int_{\mathbb{R}} [\tau_{tz} f(x) - f(x)] \phi(z) dm(z)$$

*Proof.* Let  $t \neq 0$  and  $x \in \mathbb{R}$ . The previous exercise implies that

$$f * \phi_{t}(x) - \alpha f(x) = \int_{\mathbb{R}} f(x - y)\phi_{t}(y) dm(y) - \int_{\mathbb{R}} \phi(y) dm(y) f(x)$$

$$= \int_{\mathbb{R}} f(x - y)\phi_{t}(y) dm(y) - \int_{\mathbb{R}} \phi_{t}(y) dm(y) f(x)$$

$$= \int_{\mathbb{R}} f(x - y)\phi_{t}(y) - f(x)\phi_{t}(y) dm(y)$$

$$= \int_{\mathbb{R}} [f(x - y) - f(x)]\phi_{t}(y) dm(y)$$

$$= \int_{\mathbb{R}} [f(x - y) - f(x)]t^{-1}\phi(t^{-1}y) dm(y)$$

$$= \int_{\mathbb{R}} [f(x - tz) - f(x)]\phi(z) dm(z)$$

$$= \int_{\mathbb{R}} [\tau_{tz}f(x) - f(x)]\phi(z) dm(z)$$

Tonelli's theorem implies that

$$||f * \phi_t - \alpha f||_1 = \int_{\mathbb{R}} |f * \phi_t(x) - \alpha f(x)| \, dm(x)$$

$$\leq \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |\tau_{tz} f(x) - f(x)| |\phi(z)| \, dm(z) \right] \, dm(x)$$

$$= \int_{\mathbb{R}} \left[ \int_{\mathbb{R}} |\tau_{tz} f(x) - f(x)| |\phi(z)| \, dm(x) \right] \, dm(z)$$

$$= \int_{\mathbb{R}} ||\tau_{tz} f - f||_1 |\phi(z)| \, dm(z)$$

For  $n \in \mathbb{N}$ , define  $g_n \in \mathcal{S}(\mathbb{R}^n)$  by  $g_n(z) = \|\tau_{n^{-1}z}f(x) - f(x)\|_1 \phi(z)$ . Then  $g_n \xrightarrow{\text{p.w.}} 0$  and  $|g_n| \leq 2\|f\|_1 |\phi|$   $\in L^1(\mathbb{R}^n)$ 

The dominated convergence theorem implies that

Definition 3.6.0.20. content...

### 3.7 Tempered Distributions

#### 3.8 The Fourier Transform on $\mathcal{M}(\mathbb{R})$

Note 3.8.0.1. Recall that

$$\mathcal{M}(\mathbb{R}) = \{ \mu : \mathcal{B}(\mathbb{R}) \to \mathbb{C} : \mu \text{ is a complex measure} \}$$

**Definition 3.8.0.2.** Let  $\mu \in \mathcal{M}(\mathbb{R})$ . We define the **Fourier transform of**  $\mu$ , denoted  $\hat{\mu} : \mathbb{R} \to \mathbb{C}$ , by

$$\hat{\mu}(\xi) = \int_{\mathbb{R}} e^{-i\xi x} \, d\mu(x)$$

**Exercise 3.8.0.3.** Let  $\mu \in \mathcal{M}(\mathbb{R})$ . Then Then  $\hat{\mu} : \mathbb{R} \to \mathbb{C}$  is bounded.

*Proof.* Let  $\xi \in \mathbb{R}$ .

$$|\hat{\mu}(\xi)| = \left| \int_{\mathbb{R}} e^{-i\xi x} d\mu(x) \right|$$

$$\leq \int_{\mathbb{R}} |e^{-i\xi x}| d|\mu|(x)$$

$$= |\mu|(\mathbb{R})$$

So  $\hat{\mu}$  is bounded.

**Exercise 3.8.0.4.** Let  $\mu \in \mathcal{M}(\mathbb{R})$ . Then  $\hat{\mu} \in C_b(\mathbb{R})$ .

Proof. Let  $(\xi_n)_{n\in\mathbb{N}}\subset\mathbb{R}$  and  $\xi\in\mathbb{R}$ . Define  $(f_n)_{n\in\mathbb{N}}\subset L^1(\mu)$  and  $f\in L^1(\mu)$  by  $f_n(x)=e^{-i\xi_n x}$  and  $f(x)=e^{-i\xi x}$ . Suppose that  $\xi_n\to\xi$ . Then  $f_n\xrightarrow{\mathrm{p.w.}} f$  and for each  $n\in N$  and  $x\in\mathbb{R}$ ,

$$|f_n(x)| = |e^{-i\xi_n x}|$$

$$= 1$$

$$\in L^1(|\mu|)$$

The dominated convergence theorem implies that

$$|\hat{\mu}(\xi_n) - \hat{\mu}(\xi)| = \left| \int_{\mathbb{R}} e^{-i\xi_n x} d\mu(x) - \int_{\mathbb{R}} e^{-i\xi x} d\mu(x) \right|$$

$$= \left| \int_{\mathbb{R}} e^{-i\xi_n x} - e^{-i\xi x} d\mu(x) \right|$$

$$\leq \int_{\mathbb{R}} |e^{-i\xi_n x} - e^{-i\xi x}| d|\mu|(x)$$

$$\to 0$$

So  $\hat{\mu}: \mathbb{R} \to \mathbb{C}$  is continuous. Hence  $\hat{\mu} \in C_b(\mathbb{R})$ .

**Definition 3.8.0.5.** Let X be a real normed vector space. We define  $\mathcal{F}: \mathcal{M}(\mathbb{R}) \to C_b(\mathbb{R})$  by

$$\mathcal{F}(\mu) = \hat{\mu}$$

**Exercise 3.8.0.6.** Let X be a real normed vector space. Then  $\mathcal{F}: \mathcal{M}(\mathbb{R}) \to C_b(\mathbb{R})$  is linear.

*Proof.* Let  $\mu, \nu \in \mathcal{M}(\mathbb{R})$  and  $\xi \in \mathbb{R}$ . Then

$$\mathcal{F}[\mu + \nu](\xi) = \int_{\mathbb{R}} e^{-i\xi x} d[\mu + \nu](x)$$
$$= \int_{\mathbb{R}} e^{-i\xi x} d\mu(x) + \int_{\mathbb{R}} e^{-i\xi x} d\nu(x)$$
$$= \mathcal{F}[\mu](\xi) + \mathcal{F}[\nu](\xi)$$

Since  $\xi \in \mathbb{R}$  is arbitrary,  $\mathcal{F}(\mu + \nu) = \mathcal{F}(\mu) + \mathcal{F}(\nu)$  and  $\mathcal{F}$  is linear.

**Exercise 3.8.0.7.** Let X be a real normed vector space. If X is separable, then  $\mathcal{F}$  is injective.

*Proof.* Suppose that X is separable. Let  $\mu \in \mathcal{M}(X)$ . Suppose that  $\mu \in \ker \mathcal{F}$ . Then  $\hat{\mu} = 0$  and for each  $\phi \in X^*$ ,

$$0 = \hat{\mu}(\phi)$$

$$= \int_X e^{-i\phi(x)} d\mu(x)$$

$$= \int_{\mathbb{P}} e^{-ix} d[\phi_* \mu](x)$$

**Exercise 3.8.0.8.** Let X be a real normed vector space. Then  $\mathcal{F} \in L(\mathcal{M}(X), C_b(X^*))$  and  $\|\mathcal{F}\| \leq 1$ .

*Proof.* For  $\mu \in \mathcal{M}(X)$  and  $\phi \in X^*$ , we have that

$$\begin{aligned} |\mathcal{F}[\mu](\phi)| &= \left| \int_X e^{-i\phi(x)} d\mu(x) \right| \\ &\leq \int_X |e^{-i\phi(x)}| d|\mu|(x) \\ &= |\mu|(X) \\ &= \|\mu\| \end{aligned}$$

Hence

$$\|\mathcal{F}(\mu)\| = \sup_{\phi \in X^*} |\mathcal{F}[\mu](\phi)|$$
$$\leq \|\mu\|$$

which implies that  $\mathcal{F} \in L(\mathcal{M}(X), C_b(X^*))$  and  $\|\mathcal{F}\| \leq 1$ .

## Fourier Analysis on $\mathbb{R}^n$

### 4.1 Schwartz Space

**Definition 4.1.0.1.** Let  $\alpha \in \mathbb{N}_0^n$  and  $x, y \in \mathbb{R}^n$ . We define

1. 
$$\langle x, y \rangle = \sum_{j} x_{j} y_{j}$$

2. 
$$|x| = \langle x, x \rangle^{1/2}$$

3. 
$$|\alpha| = \alpha_1 + \dots + \alpha_n$$

$$4. \ x^{\alpha} = x_1^{\alpha_1} \cdots x_n^{\alpha_n}$$

5. 
$$\partial^{\alpha} = \partial_{x_1}^{\alpha_1} \cdots \partial_{x_n}^{\alpha_n}$$

**Definition 4.1.0.2.** Let  $f \in C^{\infty}(\mathbb{R}^n), \alpha \in \mathbb{N}_0^n$  and  $N \in \mathbb{N}_0$ . We define

$$||f||_{\alpha,N} = \sup_{x \in \mathbb{R}^n} (1 + |x|)^N |\partial^{\alpha} f(x)|$$

We define Schwartz space, denoted  $\mathcal{S}(\mathbb{R}^n)$ , by

$$\mathcal{S}(\mathbb{R}^n) = \{ f \in C^{\infty}(\mathbb{R}^n) : \text{ for each } \alpha \in \mathbb{N}_0^n, \, N \in \mathbb{N}_0, \, \|f\|_{\alpha,N} < \infty \}$$

**Exercise 4.1.0.3.** For each  $f \in \mathcal{S}(\mathbb{R}^n)$  and  $\alpha \in \mathbb{N}_0^n$ ,  $\partial^{\alpha} f \in L^1(\mathbb{R}^n)$ .

*Proof.* Let  $f \in \mathcal{S}(\mathbb{R}^n)$ ,  $\alpha \in \mathbb{N}_0^n$ . Then there exists  $C \geq 0$  such that for each  $x \in \mathbb{R}^n$ ,

$$|\partial^{\alpha} f(x)| \le C(1+|x|^2)^{-1}$$

Define  $g: \mathbb{R}^n \to [0, \infty)$  defined by  $g(x) = (1 + |x|^2)^{-1}$ . Then  $g \in L^1(\mathbb{R}^n)$  which implies that  $\partial^{\alpha} f \in L^1(\mathbb{R}^n)$ .

Definition 4.1.0.4.

#### 4.2 The Convolution

**Definition 4.2.0.1.** Let  $f, g \in L^0(\mathbb{R}^n)$ . If for a.e.  $x \in \mathbb{R}^n$ ,

$$\int_{\mathbb{R}^n} |f(x-y)g(y)| dm(y) < \infty$$

we define the **convolution of** f with g, denoted  $f * g : \mathbb{R}^n \to \mathbb{C}$ , by

$$f * g(x) = \int_{\mathbb{R}^n} f(x - y)g(y)dm(y)$$

**Exercise 4.2.0.2.** Let  $f, g \in L^1(\mathbb{R}^n)$ . Then  $f * g \in L^1(\mathbb{R}^n)$  and  $||f * g||_1 \le ||f||_1 ||g||_1$ .

*Proof.* Define  $h \in L^0(\mathbb{R}^n \times \mathbb{R}^n)$  by h(x,y) = f(x-y)g(y). Tonelli's theorem implies that,

$$\begin{split} \int_{\mathbb{R}^n \times \mathbb{R}^n} |h| dm^2 &= \int_{\mathbb{R}^n} \left[ \int_{\mathbb{R}^n} |f(x-y)g(y)| dm(y) \right] dm(x) \\ &= \int_{\mathbb{R}^n} |g(y)| \left[ \int_{\mathbb{R}^n} |f(x-y)| dm(y) \right] dm(x) \\ &= \|f\|_1 \int_{\mathbb{R}^n} |g(y)| dm(x) \\ &= \|f\|_1 \|g\|_1 \\ &< \infty \end{split}$$

Then  $h \in L^1(\mathbb{R}^n \times \mathbb{R}^n)$ . Fubini's theorem implies that  $f * g \in L^1(\mathbb{R}^n)$ . Clearly

$$||f * g||_1 \le \int_{\mathbb{R}^n \times \mathbb{R}^n} |h| dm^2$$
$$\le ||f||_1 ||g||_1$$

**Exercise 4.2.0.3.** Let  $f, g, h \in L^1(\mathbb{R}^n)$ . Then (f \* g) \* h = f \* (g \* h). **Hint:** use the substitution  $z \mapsto z - y$ 

*Proof.* Let  $x \in \mathbb{R}^n$ . Then using the substitution  $z \mapsto z - y$  and Fubini's theorem, we obtain

$$(f * g) * h(x) = \int f * g(x - y)h(y)dm(y)$$

$$= \int \left[ \int f(x - y - z)g(z)dm(z) \right] h(y)dm(y)$$

$$= \int \left[ \int f(x - z)g(z - y)dm(z) \right] h(y)dm(y)$$

$$= \int \left[ \int f(x - z)g(z - y)h(y)dm(z) \right] dm(y)$$

$$= \int \left[ \int f(x - z)g(z - y)h(y)dm(y) \right] dm(z)$$

$$= \int f(x - z) \left[ \int g(z - y)h(y)dm(y) \right] dm(z)$$

$$= \int f(x - z)g * h(z)dm(z)$$

$$= f * (g * h)(z)$$

So (f \* g) \* h = f \* (g \* h).

4.2. THE CONVOLUTION 53

**Exercise 4.2.0.4.** Let  $f,g\in L^1(\mathbb{R}^n)$ . Then f\*g=g\*f.

*Proof.* Let  $x \in \mathbb{R}^n$ . Using the transformation  $y \mapsto x - y$ , we obtain that

$$f * g(x) = \int f(x - y)g(y)dm(y)$$
$$= \int f(y)g(x - y)dm(y)$$
$$= \int g(x - y)f(y)dm(y)$$
$$= g * f(x)$$

So 
$$f * g = g * f$$
.

Note 4.2.0.5. To summarize,  $(L^1(\mathbb{R}^n), *)$  is a commutative Banach algebra.

#### Exercise 4.2.0.6. Young's Inequality:

Let  $p \in [1, \infty]$ ,  $f \in L^1$  and  $g \in L^p$ . Then  $f * g \in L^p$  and  $||f * g||_p \le ||f||_1 ||g||_p$ .

*Proof.* Define  $K \in L^0(\mathbb{R}^n \times \mathbb{R}^n)$  by K(x,y) = f(x-y). Since for each  $x,y \in \mathbb{R}^n$ ,

$$\int |K(x,y)|dm(x) = \int |K(x,y)|dm(y)$$
$$= ||f||_{p}$$

an exercise in section 5.1 of [4] implies that  $f * g \in L^p$  and  $||f * g||_p \le ||f||_1 ||g||_p$ .

**Exercise 4.2.0.7.** Let  $p, q \in [1, \infty]$  be conjugate,  $f \in L^p(\mathbb{R}^n)$  and  $g \in L^q(\mathbb{R}^n)$ . Then

- 1. for each  $x \in \mathbb{R}^n$ , f \* g(x) exists.
- 2.  $||f * g||_u \le ||f||_p ||g||_q$

3.

3.

*Proof.* 1. Let  $x \in \mathbb{R}^n$ . Holder's inequality implies that

$$\int_{\mathbb{D}_n} |f(x - y)g(y)| dm(y) \le ||f||_p ||g||_q$$

Then f \* g(x) exists.

2. Let  $x \in \mathbb{R}^n$ . Then in part (1) we showed that

$$|f * g(x)| = \left| \int_{\mathbb{R}^n} f(x - y)g(y)dm(y) \right|$$

$$\leq \int_{\mathbb{R}^n} |f(x - y)g(y)|dm(y)$$

$$\leq ||f||_p ||g||_q$$

Since  $x \in \mathbb{R}^n$  is arbitrary,  $||f * g||_u \le ||f||_p ||g||_q$ .

**Exercise 4.2.0.8.** Let  $f \in L^1(\mathbb{R}^n)$ ,  $k \in \mathbb{N}$  and  $g \in C^k(\mathbb{R}^n)$ . Suppose that for each  $\alpha \in \mathbb{N}_0^n$ ,  $|\alpha| \le k$  implies that  $\partial^{\alpha} g \in L^{\infty}$ . Then for each  $\alpha \in \mathbb{N}_0^n$ ,  $|\alpha| \le k$  implies that  $f * g \in C^k$  and

$$\partial^{\alpha}(f * g) = f * \partial^{\alpha}g$$

Proof. Let  $\alpha \in \mathbb{N}_0^n$ . Suppose that  $|\alpha| = 1$ . Define  $h \in L^0(\mathbb{R}^n \times \mathbb{R}^n)$  by h(x,y) = g(x-y)f(y). Young's inequality imples that for a.e.  $x \in \mathbb{R}^n$ ,  $h(x,\cdot) \in L^1(\mathbb{R}^n)$ . For each  $y \in \mathbb{R}^n$ ,  $\partial^{\alpha}h(\cdot,y) = \partial^{\alpha}g(\cdot -y)f(y)$  and for each  $x,y \in \mathbb{R}^n$ ,  $|\partial^{\alpha}h(x,y)| \leq ||\partial^{\alpha}g||_{\infty}|f(y)| \in L^1(\mathbb{R}^n)$ . An exercise in section 3.3 of [4] implies that for a.e.  $x \in \mathbb{R}^n$ ,  $\partial^{\alpha}(g * f)(x)$  exists and

$$\begin{split} \partial^{\alpha}(f*g)(x) &= \partial^{\alpha}(g*f)(x) \\ &= \partial^{\alpha} \int_{\mathbb{R}^{n}} h(x,y) dm(y) \\ &= \int_{\mathbb{R}^{n}} \partial^{\alpha} g(x-y) f(y) dm(y) \\ &= (\partial^{\alpha} g) * f(x) \\ &= f*(\partial^{\alpha} g)(x) \end{split}$$

Now proceed by induction on  $|\alpha|$ .

### 4.3 The Fourier Transform

Definition 4.3.0.1.

**Exercise 4.3.0.2.** Let  $\phi: \mathbb{R} \to S^1$  be a measurable homomorphism.

1. Then  $\phi \in L^1_{loc}(\mathbb{R})$  and there exists a > 0 such that

$$\int_{(0,a]} \phi dm \neq 0$$

2. Define

$$c = \left[ \int_{(0,a]} \phi dm \right]^{-1}$$

Then For each  $x \in \mathbb{R}$ ,

$$\phi(x) = c \int_{(x,x+a]} \phi dm$$

3.  $\phi \in C^{\infty}(\mathbb{R})$  and  $\phi' = c(\phi(a) - 1)\phi$ 

4. Define  $b = c(\phi(a) - 1)$  and  $g \in C^{\infty}(\mathbb{R})$  by  $g(x) = e^{-bx}\phi(x)$ . Then g is constant and there exists  $\xi \in \mathbb{R}$  such that for each  $x \in \mathbb{R}$ ,  $\phi(x) = e^{2\pi i \xi x}$ .

Proof.

1. Let  $K \subset \mathbb{R}$  be compact. Then

$$\int_K |\phi| dm = m(K) < \infty$$

So  $\phi \in L^1_{loc}(\mathbb{R})$ . For the sake of contradiction, suppose that for each a > 0,

$$\int_{(0,a]} \phi dm = 0$$

Then the FTC implies that  $\phi = 0$  a.e. on  $[0, \infty)$ , which is a contradiction. So there exists a > 0 such that

$$\int_{(0,a]} \phi dm \neq 0$$

2. For  $x \in \mathbb{R}$ ,

$$\phi(x) = c \int_{(0,a]} \phi(x)\phi(t)dm(t)$$
$$= c \int_{(0,a]} \phi(x+t)dm(t)$$
$$= c \int_{(x,x+a]} \phi dm$$

3. Part (2) and the FTC imply that  $\phi$  is continuous. Let  $d \in \mathbb{R}$ . Define  $f_d \in C((d, \infty))$  by

$$f_d(x) = \int_{(d,x]} \phi dm$$

Since  $\phi$  is continuous, the FTC implies that  $f_d$  is differentiable and for each x > d  $f'_d(x) = \phi(x)$ . Part (2) implies that for each x > d,

$$\phi(x) = c \int_{(x,x+a]} \phi dm$$
$$= c(f_d(x+a) - f_d(x))$$

So for each x > d,  $\phi$  is differentiable at x and

$$\phi'(x) = c(\phi(x+a) - \phi(x))$$
$$= c(\phi(a) - 1)\phi(x)$$

Since  $d \in \mathbb{R}$  is arbitrary,  $\phi$  is differentiable and  $\phi' = c(\phi(a) - 1)\phi$ . This implies that  $\phi \in C^{\infty}(\mathbb{R})$ .

4. Let  $x \in \mathbb{R}$ . Then

$$g'(x) = e^{-bx}\phi'(x) - be^{-bx}\phi(x)$$
$$= be^{-bx}\phi(x) - be^{-bx}\phi(x)$$
$$= 0$$

So g'=0 and g is constant. Hence there exists  $k \in \mathbb{R}$  such that for each  $x \in \mathbb{R}$ ,  $\phi(x)=ke^{bx}$ . Since  $\phi(0)=1$ , k=1. Since  $|\phi|=1$ , there exists  $\xi \in \mathbb{R}$  such that  $b=2\pi i \xi$ .

**Note 4.3.0.3.** To summarize, for each measurable homomorphism  $\phi : \mathbb{R} \to S^1$ , there exists  $\xi \in \mathbb{R}$  such such that for each  $x \in \mathbb{R}$ ,  $\phi(x) = e^{2\pi i \xi x}$ .

**Exercise 4.3.0.4.** Let  $\phi: \mathbb{R}^n \to S^1$  be a measurable homomorphism. Then there exists  $\xi \in \mathbb{R}^n$  such that for each  $x \in \mathbb{R}^n$ ,  $\phi(x) = e^{2\pi i \langle \xi, x \rangle}$ .

*Proof.* When done in the category of measurable groups, an exercise in the section on direct products of groups of [?] implies that there exist measurable homomorphism  $(\phi_j)_{j=1}^n \subset (S^1)^{\mathbb{R}}$  such that  $\phi = \bigotimes_{j=1}^n \phi_j$ . The previous exercise implies that there exist  $\xi \in \mathbb{R}^n$  such that for each  $x \in \mathbb{R}^n$ ,  $\phi_j(x_j) = e^{2\pi i \xi_j x_j}$ . Then for each  $x \in \mathbb{R}^n$ ,

$$\phi(x) = \prod_{j=1}^{n} \phi_j(x_j)$$

$$= \prod_{j=1}^{n} e^{2\pi i \xi_j x_j}$$

$$= e^{2\pi i \sum_{j=1}^{n} \xi_j x_j}$$

$$= e^{2\pi i \langle \xi, x \rangle}$$

**Definition 4.3.0.5.** Let  $f \in L^1(\mathbb{R}^n)$ . We define the **Fourier transform of** f, denoted  $\hat{f} : \mathbb{R}^n \to \mathbb{C}$  by

$$\hat{f}(\xi) = \frac{1}{(2\pi)^{n/2}} \int_{\mathbb{R}^n} f(x) e^{-2\pi i \langle \xi, x \rangle} dm(x)$$

### Fourier Analysis on LCA Groups

#### 5.1 The Convolution

Note 5.1.0.1. For the remainder of the section, we fix a locally compact abelian group G and a Haar measure  $\mu$  on G.

**Definition 5.1.0.2.** Let  $f, g \in L^1(\mu)$ . We define the **convolution of** f with g, denoted  $f * g : G \to \mathbb{C}$ , by

$$f * g(x) = \int_{X} f(x - y)g(y)d\mu(y)$$

Exercise 5.1.0.3. Let  $f,g\in L^1(\mu)$ . Then  $f*g\in L^1(\mu)$ .

*Proof.* By Tonelli's theorem,

$$\begin{split} \int_X |f*g| d\mu &\leq \int_X \bigg[ \int_X |f(x-y)g(y)| d\mu(y) \bigg] d\mu(x) \\ &= \int_X |g(y)| \bigg[ \int_X |f(x-y)| d\mu(y) \bigg] d\mu(x) \\ &= \|f\|_1 \int_X |g(y)| d\mu(x) \\ &= \|f\|_1 \|g\|_1 \\ &< \infty \end{split}$$
