Chapter 1

Set Theory

1.1 Operations and Relations

Definition 1.1.0.1.

- We define $[0] := \emptyset$ and for $k \in \mathbb{N}$, we define $[k] := \{1, \dots, k\}$.
- Let S be a set and $k \in \mathbb{N}_0$. We define the **set of** k-tupels with entries in S, denoted S^k , by

$$S^k := \{u : [k] \to S\}$$

• Let S be a set. We define the set of all tuples with entries in S, denoted S^* , by

$$S^* := \bigcup_{k \in \mathbb{N}_0} S^k$$

• Let S be a set and $k \in \mathbb{N}_0$. We define the **set of** k-ary operations on S, denoted $\mathcal{F}^k(S)$, by $\mathcal{F}^k(S) := S^{(S^k)}$. We define the **set of finitary operations on** S, denoted $\mathcal{F}^*(S)$, by

$$\mathcal{F}^*(S) := \bigcup_{k \in \mathbb{N}_0} \mathcal{F}^k(S)$$

• Let S be a set. We define the **operation arity map**, denoted arity: $\mathcal{F}^*(S) \to \mathbb{N}_0$, by

arity
$$f := k$$
, $f \in \mathcal{F}^k(S)$

• Let S be a set, $\mathcal{F} \subset \mathcal{F}^*(S)$ and $k \in \mathbb{N}_0$. We define the k-ary members of \mathcal{F} , denoted \mathcal{F}_k , by

$$\mathcal{F}_k := \mathcal{F} \cap \mathcal{F}^k(S)$$

• Let S be a set and $k \in \mathbb{N}_0$. We define the **set of** k-ary relations on S, denoted $\mathcal{R}^k(S)$, by $\mathcal{R}^k(S) := \mathcal{P}(S^k)$. We define the **set of finitary relations on** S, denoted $\mathcal{R}^*(S)$, by

$$\mathcal{R}^*(S) := \bigcup_{k \in \mathbb{N}_0} \mathcal{R}^k(S)$$

• Let S be a set. We define the **arity map**, denoted arity: $\mathcal{R}^*(S) \to \mathbb{N}_0$, by

arity
$$R := k$$
, $f \in \mathcal{R}^k(S)$

• Let S be a set, $\mathcal{R} \subset \mathcal{R}^*(S)$ and $k \in \mathbb{N}_0$. We define the k-ary members of \mathcal{R} , denoted \mathcal{R}_k , by

$$\mathcal{R}_k := \mathcal{R} \cap \mathcal{R}^k(S)$$

Definition 1.1.0.2. Let S be a set, $k \geq 2$ and $f \in \mathcal{F}^k(S)$. Then f is said to be

• associative if for each $x_1, \ldots, x_k, x_{k+1}, \ldots, x_{k+(k-1)} \in S$,

$$f(f(x_1, \dots, x_k)x_{k+1}, \dots, x_{k+(k-1)}) = f(x_1, f(x_2, \dots, x_{k+1}), x_{k+2}, \dots, x_{k+(k-1)})$$

$$\vdots$$

$$= f(x_1, \dots, x_{k-1}, f(x_k, \dots, x_{k+(k-1)}))$$

- symmetric if for each $x_1, \ldots, x_k \in S$, $\sigma \in S_k$, $f(x_1, \ldots, x_k) = f(x_{\sigma(1)}, \ldots, x_{\sigma(k)})$.
- **idempotent** if for each $x \in S$, f(x, ..., x) = x

Definition 1.1.0.3. Let S be a set, $\mathcal{F} \subset \mathcal{F}^*(S)$ and $C \subset S$. Then C is said to be \mathcal{F} -closed if for each $k \in \mathbb{N}_0$, $f \in \mathcal{F}_k$ and $a \in C^k$, $f(a) \in C$.

Exercise 1.1.0.4. Let S be a set, $\mathcal{F} \subset \mathcal{F}^*(S)$ and $\mathcal{C} \subset \mathcal{P}(S)$. If for each $C \in \mathcal{C}$, C is \mathcal{F} -closed, then $\bigcap_{C \in \mathcal{C}} C$ is \mathcal{F} -closed need special case where k = 0? maybe trivially true?

Proof. Suppose that for each $C \in \mathcal{C}$, C is \mathcal{F} -closed. Let $k \in \mathbb{N}_0$, $f \in \mathcal{F}_k$, $a_1, \ldots, a_k \in \bigcap_{C \in \mathcal{C}} C$ and $C_0 \in \mathcal{C}$. Since $C_0 \in \mathcal{C}$, we have that

$$a_1, \dots, a_k \in \bigcap_{C \in \mathcal{C}} C$$

$$\subset C_0$$

Since C_0 is \mathcal{F} -closed, we have that $f(a_1, \ldots, a_k) \in C_0$. Since $C_0 \in \mathcal{C}$ is arbitrary, we have that for each $C \in \mathcal{C}$, $f(a_1, \ldots, a_k) \in C$. Hence $f(a_1, \ldots, a_k) \in \bigcap_{C \in \mathcal{C}} C$. Since $k \in \mathbb{N}_0$ and $a_1, \ldots, a_k \in \bigcap_{C \in \mathcal{C}} C$ are arbitrary, we have that $\bigcap_{C \in \mathcal{C}} C$ is \mathcal{F} -closed. \square

Chapter 2

Ordered Sets

2.1 To Do

at this point, there should be a simple structure capturing prosets and $\downarrow S$, measurable spaces and $\sigma(A)$, topological spaces and $\tau(\mathcal{E})$, groups/rings/···/algebras and $\langle S \rangle/(E)/\cdots/(F)$. It seems like we need a category \mathcal{C} with some structure, another category \mathcal{C}_F which is like \mathcal{C} , but less structured and some forgetful-like functor $F: \mathcal{C} \to \mathcal{C}_F$. eg, $F: \mathbf{Pro} \to \mathbf{Set}$ or $F: \mathbf{Top} \to \mathbf{Set}$ and we need an associated poset \mathcal{P} containing the structure forgotten by F, e.g. the lower sets of X or the set of topologies on X and we need a "generating" or "contained" object \mathcal{E} in \mathcal{C}_F in the sense that there is at least one object A in C and monomirphism $\iota_A: \mathcal{E} \to F(A)$ in C_F . We then need a minimal element in the structure poset \mathcal{P} in some universal sense relating to these monomorphisms. Ask people who know category theory

2.2 Prosets

2.2.1 Introduction

Definition 2.2.1.1. Preordered Set:

Let X be a set and $\leq \subset X \times X$ a binary relation on X. Then

- \leq is said to be a **preorder on** X if
 - 1. for each $a \in X$, $a \le a$
 - 2. for each $a,b,c\in X,\,a\leq b$ and $b\leq c$ implies that $a\leq c$
- (X, \leq) is said to be a **preordered set** or **proset** if \leq is a preorder on X.

Definition 2.2.1.2. Let (X, \leq) be a proset. We define the **dual order of** \leq **on** X, denoted $\leq^{\text{op}} b$ iff $b \leq a$.

Exercise 2.2.1.3. Let (X, \leq) be a proset. Then \leq^{op} is a preorder on X.

Proof.

- 1. Let $a \in X$. Since $a \leq a$, we have that $a \leq^{op} a$.
- 2. Let $a, b, c \in X$. Suppose that $a \leq^{\text{op}} b$ and $b \leq^{\text{op}} c$. Then $b \leq a$ and $c \leq b$. Hence $c \leq a$. Thus $a \leq^{\text{op}} c$.

Therefore \leq^{op} is a preorder on X.

2.2.2 Products

Definition 2.2.2.1. Let (A, \leq_A) and (B, \leq_B) be prosets. We define the

• product preorder of \leq_A and \leq_B on $A \times B$, denoted $\leq_A \otimes \leq_B$ by $(a_1, b_1) \leq_A \otimes \leq_B (a_2, b_2)$ iff $a_1 \leq_A a_2$ and $b_1 \leq_B b_2$.

• product proset of (A, \leq_A) and (B, \leq_B) , denoted $(A, \leq_A) \otimes (B, \leq_B)$ by $(A, \leq_A) \otimes (B, \leq_B) := (A \times B, \leq_A \otimes \leq_B)$

Exercise 2.2.2. probably need to change notation since \otimes might be reserved for something else. Let (A, \leq_A) and (B, \leq_B) be prosets. Then

- 1. $\leq_A \otimes \leq_B$ is a preorder on $A \times B$,
- 2. $(A, \leq_A) \otimes (B, \leq_B)$ is a proset.

Proof.

- 1. (a) Let $(a,b) \in A \times B$. Then $a \leq_A a$ and $b \leq_B b$. Therefore $(a,b) \leq_A \otimes \leq_B (a,b)$.
 - (b) Let $(a_1, b_1), (a_2, b_2), (a_3, b_3) \in A \times B$. Suppose that $(a_1, b_1) \leq_A \otimes \leq_B (a_2, b_2)$ and $(a_2, b_2) \leq_A \otimes \leq_B (a_3, b_3)$. Then $a_1 \leq_A a_2, a_2 \leq_A a_3, b_1 \leq_B b_2$ and $b_2 \leq_B b_3$. Therefore $a_1 \leq_A a_3$ and $b_1 \leq_B b_3$. Hence $(a_1, b_1) \leq_A \otimes \leq_B (a_3, b_3)$.

Hence $\leq_A \otimes \leq_B$ is a preorder on $A \times B$.

2. Since $\leq_A \otimes \leq_B$ is a preorder on $A \times B$, (X, \leq) is a proset.

Definition 2.2.2.3. Let (X, \leq) be a proset. We define $\sim_{\leq} \subset X \times X$ by $a \sim_{\leq} b$ iff $a \leq b$ and $b \leq a$.

Exercise 2.2.2.4. Let (X, \leq) be a proset. Then \sim_{\leq} is an equivalence relation on X.

Proof. Let $x, y, z \in X$.

- 1. Since $x \leq x$, $x \sim < x$.
- 2. Suppose that $x \sim_{\leq} y$. Then $x \leq y$ and $y \leq x$. Thus $y \sim_{\leq} x$.
- 3. Suppose that $x \sim_{\leq} y$ and $y \sim_{\leq} z$. Then $x \leq y, y \leq x, y \leq z$ and $z \leq y$. Therefore $x \leq z$ and $z \leq x$. Hence $x \sim_{\leq} z$.

2.2.3 Upper and Lower Sets

Definition 2.2.3.1. Let (X, \leq) be a proset and $A \subset X$. Then

- A is said to be a \leq -upper set if for each $a \in A$ and $x \in X$, $a \leq x$ implies that $x \in A$.
- A is said to be an \leq -lower set if for each $a \in A$ and $x \in X$, $x \leq a$ implies that $x \in A$.

Note 2.2.3.2. When the context is clear, we say A is a

- "upper set" instead of "\leq-upper set"
- \bullet "lower set" instead of " \leq -lower set"

Exercise 2.2.3.3. Let (X, \leq) be a proset. Then

- 1. X is a \leq -upper set
- 2. X is a \leq -lower set

Proof.

- 1. Let $a, x \in X$. Suppose that $a \le x$. By assumption, $x \in X$. Since $a, x \in X$ with $a \le x$ are arbitrary, we have that for each $a, x \in X$, $a \le x$ implies that $x \in A$. Hence X is a \le -upper set.
- 2. Similar to (1).

Exercise 2.2.3.4. Let (X, \leq) be a proset and $A \subset X$. Then

- 1. A is a \leq -upper set iff A is a \leq ^{op}-lower set
- 2. A is a \leq -lower set iff A is a \leq ^{op}-upper set

Proof.

1. \bullet (\Longrightarrow):

Suppose that A is a \leq -upper set. Let $a \in A$ and $x \in X$. Suppose that $x \leq^{\text{op}} a$. Then $a \leq x$. Since A is a \leq -upper set, $x \in A$. Since $a \in A$ and $x \in X$ with $x \leq^{\text{op}} a$ is arbitrary, we have that for each $a \in A$ and $x \in X$, $x \leq^{\text{op}} a$ implies that $x \in A$. Hence A is a \leq^{op} -lower set.

(⇐⇐):

Suppose that A is a \leq^{op} -lower set. Let $a \in A$ and $x \in X$. Suppose that $a \leq x$. Then $x \leq^{\text{op}} a$. Since A is a \leq^{op} -lower set, $x \in A$. Since $a \in A$ and $x \in X$ with $a \leq x$ is arbitrary, we have that for each $a \in A$ and $x \in X$, $a \leq x$ implies that $x \in A$. Hence A is a \leq -upper set.

2. Similar to (1).

Exercise 2.2.3.5. Let (X, \leq) be a proset and $A \subset X$. Then

- 1. A is an upper set iff A^c is a lower set
- 2. A is a lower set iff A^c is an upper set

Proof.

1. \bullet (\Longrightarrow):

Suppose that A is an upper set. Let $b \in A^c$ and $x \in X$. Suppose that $x \leq b$. For the sake of contradiction, suppose that $x \in A$. Since $x \leq b$ and A is an upper set, $b \in A$. This is a contradiction since $b \in A^c$. Hence $x \in A^c$. Since $b \in A^c$ and $x \in X$ with $x \leq b$ are arbitrary, we have that for each $b \in A^c$ and $x \in X$, $x \leq b$ implies that $x \in A^c$. Thus A^c is a lower set.

(⇐⇐):

Suppose that A^c is a \leq -lower set. Exercise 2.2.3.4 implies that A^c is a \leq ^{op}-upper set. The previous part implies that A is a \leq ^{op}-lower set. Another application of Exercise 2.2.3.4 implies that A is a \leq -upper set.

2. Similar to (1).

Exercise 2.2.3.6. Let (X, \leq) be a proset, $(E_{\alpha})_{\alpha \in A} \subset \mathcal{P}(X)$.

- 1. If for each $\alpha \in A$, E_{α} is an upper set, then
 - (a) $\bigcup_{\alpha \in A} E_{\alpha}$ is an upper set
 - (b) $\bigcap_{\alpha \in A} E_{\alpha}$ is an upper set
- 2. If for each $\alpha \in A$, E_{α} is a lower set, then
 - (a) $\bigcup_{\alpha \in A} E_{\alpha}$ is a lower set
 - (b) $\bigcap_{\alpha \in A} E_{\alpha}$ is an lower set

Proof.

1. Suppose that for each $\alpha \in A$, E_{α} is an upper set. Set $E := \bigcup_{\alpha \in A} E_{\alpha}$.

(a) Let $e \in E$ and $x \in X$. Suppose that $e \le x$. Since $e \in E$, there exists $\alpha \in A$ such that $e \in E_{\alpha}$. Since E_{α} is an upper set and $e \le x$, we have that

$$x \in E_{\alpha}$$

$$\subset \bigcup_{\alpha \in A} E_{\alpha}$$

$$= E.$$

Since $e \in E$ and $x \in X$ with $e \le x$ are arbitrary, we have that for each $e \in E$ and $x \in X$, $e \le x$ implies that $x \in E$. Hence E is an upper set.

- (b) Let $\alpha \in A$. Since E_{α} is a \leq -upper set, Exercise 2.2.3.5 implies that E_{α}^{c} is a \leq -lower set. Exercise 2.2.3.4 then implies that E_{α}^{c} is a \leq ^{op}-upper set. Since $\alpha \in A$ is arbitrary, we have that for each $\alpha \in A$, E_{α}^{c} is a \leq ^{op}-upper set. The previous part implies that $\bigcup_{\alpha \in A} E_{\alpha}^{c}$ is a \leq ^{op}-upper set. Since $\bigcap_{\alpha \in A} E_{\alpha} = \left(\bigcup_{\alpha \in A} E_{\alpha}^{c}\right)^{c}$, Exercise 2.2.3.5 implies that $\bigcap_{\alpha \in A} E_{\alpha}$ is a \leq -upper set.
- 2. Similar to (1).

Definition 2.2.3.7. Let (X, \leq) be a proset and $S \subset X$. We define the

- \leq -upper sets containing S, denoted $\mathcal{U}(S,\leq) \subset \mathcal{P}(X)$, by $\mathcal{U}(S,\leq) := \{U \subset X : U \text{ is a } \leq \text{-upper set and } S \subset U\}$
- \leq -lower sets containing S, denoted $\mathcal{L}(S, \leq) \subset \mathcal{P}(X)$, by $\mathcal{L}(S, \leq) := \{L \subset X : L \text{ is a } \leq \text{-lower set and } S \subset L\}$.
- \leq -upper set generated by S, denoted $\uparrow(S,\leq)$, by $\uparrow(S,\leq) := \bigcap_{U \in \mathcal{U}(S,<)} U$
- \leq -lower set generated by S, denoted $\downarrow(S,\leq)$, by $\downarrow(S,\leq) := \bigcap_{L \in \mathcal{L}(S,\leq)} L$

Note 2.2.3.8.

- When the context is clear, we write $\mathcal{U}(S)$, $\mathcal{L}(S)$, $\uparrow S$ and $\downarrow S$ in place of $\mathcal{U}(S, \leq)$, $\mathcal{L}(S, \leq)$, $\uparrow (S, \leq)$ and $\downarrow (S, \leq)$ respectively.
- If $S = \{s\}$, we write $\uparrow s$ and $\downarrow s$ in place of $\uparrow S$ and $\downarrow S$ respectively.
- Exercise 2.2.3.3 implies that $X \in \mathcal{U}(S)$ and $X \in \mathcal{L}(S)$.
- Exercise 2.2.3.6 implies that $\uparrow S \in \mathcal{U}(S)$ and $\downarrow S \in \mathcal{L}(S)$.

Exercise 2.2.3.9. Let (X, <) be a proset and $S \subset X$. Then

- 1. $\mathcal{U}(S, \leq^{\mathrm{op}}) = \mathcal{L}(S, \leq),$
- 2. $\mathcal{L}(S, \leq^{\mathrm{op}}) = \mathcal{U}(S, \leq),$
- 3. $\uparrow(S, \leq^{\mathrm{op}}) = \downarrow(S, \leq),$
- 4. $\downarrow(S, \leq^{\text{op}}) = \uparrow(S, \leq)$.

Proof.

- 1. Let $L \in \mathcal{U}(S, \leq^{\text{op}})$. Then $S \subset L$ and L is a \leq^{op} -upper set. Exercise 2.2.3.4 then implies that L is a \leq -lower set. Hence $L \in \mathcal{L}(S, \leq)$. Since $L \in \mathcal{U}(S, \leq^{\text{op}})$ is arbitrary, we have that for each $L \in \mathcal{U}(S, \leq^{\text{op}})$, $L \in \mathcal{L}(S, \leq)$. Thus $\mathcal{U}(S, \leq^{\text{op}}) \subset \mathcal{L}(S, \leq)$.
 - Let $L \in \mathcal{L}(S, \leq)$. Then $S \subset L$ and L is a \leq -lower set. Another application of Exercise 2.2.3.4 implies that L is a \leq^{op} -upper set. Hence $L \in \mathcal{U}(S, \leq^{\text{op}})$. Since $L \in \mathcal{L}(S, \leq)$ is arbitrary, we have that for each $L \in \mathcal{L}(S, \leq)$, $L \in \mathcal{U}(S, \leq^{\text{op}})$. Thus $\mathcal{L}(S, \leq) \subset \mathcal{U}(S, \leq^{\text{op}})$.

Since $\mathcal{U}(S, \leq^{\mathrm{op}}) \subset \mathcal{L}(S, \leq)$ and $\mathcal{L}(S, \leq) \subset \mathcal{U}(S, \leq^{\mathrm{op}})$, we have that $\mathcal{U}(S, \leq^{\mathrm{op}}) = \mathcal{L}(S, \leq)$.

2. By (1), we have that

$$\mathcal{L}(S, \leq^{\text{op}}) = \mathcal{U}(S, (\leq^{\text{op}})^{\text{op}})$$
$$= \mathcal{U}(S, \leq).$$

3. Part (1) implies that

$$\uparrow(S, \leq^{\text{op}}) = \bigcap_{U \in \mathcal{U}(S, \leq^{\text{op}})} U$$
$$= \bigcap_{U \in \mathcal{L}(S, \leq)} U$$
$$= \downarrow(S, \leq^{\text{op}}).$$

4. Similar to (3).

Exercise 2.2.3.10. Let (X, \leq) be a proset and $S \subset X$. Then

1.
$$S \in \mathcal{U}(S, \leq)$$
 iff $\uparrow S = S$

2.
$$S \in \mathcal{L}(S, \leq)$$
 iff $\downarrow S = S$

Proof.

1. • (\Longrightarrow): Suppose that $S \in \mathcal{U}(S, \leq)$. Then

$$\uparrow S = \bigcap_{U \in \mathcal{U}(S, \leq)} U$$

$$\subset S$$

$$\subset \uparrow S.$$

Hence $\uparrow S = S$.

• (\iff): Suppose that $\uparrow S = S$. Then

$$S = \uparrow S$$
$$\in \mathcal{U}(S, \leq).$$

2. Similar to (1).

Exercise 2.2.3.11. Let (X, \leq) be a proset and $a \in X$. Then

$$1. \uparrow a = \{x \in X : a \le x\}$$

$$2. \downarrow a = \{x \in X : x \le a\}$$

Proof.

1. Define $U \subset X$ by $U := \{x \in X : a \leq x\}$.

• Let $u \in U$ and $x \in X$. Suppose that $u \leq x$. Then

$$a \le u$$

 $\le x$.

Hence $x \in U$. Since $u \in U$ and $x \in X$ with $u \le x$ are arbitrary, we have that for each $u \in U$ and $x \in X$, $u \le x$ implies that $x \in U$. Hence U is an upper set. Since $a \le a$, $a \in U$. By definition, $U \in \mathcal{U}(a)$. Therefore

$$\uparrow a = \bigcap_{U' \in \mathcal{U}(a)} U'$$
$$\subset U.$$

• Let $x \in U$ and $U' \in \mathcal{U}(a)$. Since $x \in U$, $a \le x$. Since $U' \in \mathcal{U}(a)$, U' is an upper set and $a \in U'$. Thus $x \in U'$. Since $U' \in \mathcal{U}(a)$ is arbitrary, we have that for each $U' \in \mathcal{U}(a)$, $x \in U'$. Thus

$$x \in \bigcap_{U' \in \mathcal{U}(a)} U'$$
$$= \uparrow a.$$

Since $x \in U$ is arbitrary, we have that for each $x \in U$, $x \in \uparrow a$. Hence $U \subset \uparrow a$.

Since $\uparrow a \subset U$ and $U \subset \uparrow a$, we have that $\uparrow a = U$.

2. Exercise 2.2.3.4 and (1) imply that

$$\downarrow(a, \leq) = \uparrow(a, \leq^{\text{op}})
= \{x \in X : a \leq^{\text{op}} x\}
= \{x \in X : x \leq a\}.$$

Exercise 2.2.3.12. Let (X, \leq) be a proset and $S_1, S_2 \subset X$. If $S_1 \subset S_2$, then

- 1. $\uparrow S_1 \subset \uparrow S_2$
- $2. \downarrow S_1 \subset \downarrow S_2$

Proof. Suppose that $S_1 \subset S_2$.

1. Since $\uparrow S_2 \in \mathcal{U}(S_2)$, $S_2 \subset \uparrow S_2$ and $\uparrow S_2$ is an upper set. Since

$$S_1 \subset S_2$$
$$\subset \uparrow S_2,$$

we have that $\uparrow S_2 \in \mathcal{U}(S_1)$. Therefore

$$\uparrow S_1 = \bigcap_{U \in \mathcal{U}(S_1)} U$$
$$\subset \uparrow S_2.$$

2. Part (1) and Exercise 2.2.3.9 implies that

$$\downarrow(S_1, \leq) = \uparrow(S_1, \leq^{\text{op}})
\subset \uparrow(S_2, \leq^{\text{op}})
= \downarrow(S_2, \leq).$$

Exercise 2.2.3.13. Let (X, \leq) be a proset and $a, b \in X$. Then the following are equivalent:

- 1. $a \le b$,
- $2. \uparrow b \subset \uparrow a$
- $3. \downarrow a \subset \downarrow b.$

Proof.

 $1. (1) \implies (2)$:

Suppose that $a \leq b$. Since $\uparrow a \in \mathcal{U}(a)$, we have that $a \in \uparrow a$ and $\uparrow a$ is an upper set. Since $a \leq b$, we have that $b \in \uparrow a$. Hence $\uparrow a \in \mathcal{U}(b)$. Therefore

$$\uparrow b = \bigcap_{U \in \mathcal{U}(b)} U$$
$$\subset \uparrow a.$$

 $2. (2) \implies (3)$:

Suppose that $\uparrow(b, \leq) \subset \uparrow(a, \leq)$. Exercise 2.2.3.11 then implies that

$$b \in \uparrow(b, \leq)$$

$$\subset \uparrow(a, \leq)$$

$$= \{x \in X : a \leq x\}.$$

Hence $a \leq b$. Thus $b \leq^{\text{op}} a$. Exercise 2.2.3.9 and part (1) \implies (2) then imply that

$$\downarrow(a, \leq) = \uparrow(a, \leq^{op})
\subset \uparrow(b, \leq^{op})
= \downarrow(b, \leq).$$

 $3. (3) \Longrightarrow (1)$:

Suppose that $\downarrow a \subset \downarrow b$. Exercise 2.2.3.11 then implies that

$$a \in \downarrow a$$

$$\subset \downarrow b$$

$$= \{x \in X : x \le b\}.$$

Hence $a \leq b$.

Exercise 2.2.3.14. Let (X, \leq) be a proset and $S \subset X$. Then

1.
$$\uparrow S = \bigcup_{s \in S} \uparrow s$$

$$2. \downarrow S = \bigcup_{s \in S} \downarrow s$$

Proof.

1. Define $U \subset X$ by $U := \bigcup_{s \in S} \uparrow s$.

• Since for each $s \in S$, $\uparrow s$ is an upper set, Exercise 2.2.3.6 implies that U is an upper set. Let $s \in S$. Then

$$s \in \uparrow s$$

$$\subset \bigcup_{s \in S} \uparrow s$$

$$= U.$$

Since $s \in S$ is arbitrary, we have that for each $s \in S$, $s \in U$. Hence $S \subset U$. Therefore $U \in \mathcal{U}(S)$ and

$$\uparrow S = \bigcap_{U' \in \mathcal{U}(S)} U'$$

$$\subset U.$$

• Let $x \in U$ and $U' \in \mathcal{U}(S)$. Since $x \in U$, there exists $s \in S$ such that $x \in \uparrow s$. Exercise 2.2.3.11 then implies that $s \leq x$. Since $U' \in \mathcal{U}(S)$, U' is an upper set and $S \subset U'$. Then

$$s \in S$$

 $\subset U'$.

Since U' is an upper set and $s \leq x, x \in U'$. Since $U' \in \mathcal{U}(S)$ is arbitrary, we have that for each $U' \in \mathcal{U}(S), x \in U'$. Thus

$$x \in \bigcap_{U' \in \mathcal{U}(S)} U'$$
$$= \uparrow S.$$

Since $x \in U$ is arbitrary, we have that for each $x \in U$, $x \in \uparrow S$. Hence $U \subset \uparrow S$.

Since $\uparrow S \subset U$ and $U \subset \uparrow S$, we have that $\uparrow S = U$.

2. Similar to (1).

Exercise 2.2.3.15. Let (X, \leq) be a proset and $(E_{\alpha})_{\alpha \in A} \subset \mathcal{P}(X)$. Then

1.
$$\uparrow \bigcup_{\alpha \in A} E_{\alpha} = \bigcup_{\alpha \in A} \uparrow E_{\alpha}$$

$$2. \downarrow \bigcup_{\alpha \in A} E_{\alpha} = \bigcup_{\alpha \in A} \downarrow E_{\alpha}$$

Proof.

1. • Let $x \in \uparrow \bigcup_{\alpha \in A} E_{\alpha}$. Exercise 2.2.3.14 implies that there exists $y \in \bigcup_{\alpha \in A} E_{\alpha}$ such that $x \in \uparrow y$. Then there exists $\alpha_0 \in A$ such that $y \in E_{\alpha_0}$. Since $\{y\} \subset E_{\alpha_0}$, Exercise 2.2.3.12 implies that $\uparrow y \subset \uparrow E_{\alpha_0}$. Therefore

$$x \in \uparrow y$$

$$\subset \uparrow E_{\alpha_0}$$

$$\subset \bigcup_{\alpha \in A} \uparrow E_{\alpha}.$$

Since $x \in \uparrow \bigcup_{\alpha \in A} E_{\alpha}$ is arbitrary, we have that for each $x \in \uparrow \bigcup_{\alpha \in A} E_{\alpha}$, $x \in \bigcup_{\alpha \in A} \uparrow E_{\alpha}$. Hence $\uparrow \bigcup_{\alpha \in A} E_{\alpha} \subset \bigcup_{\alpha \in A} \uparrow E_{\alpha}$.

• Let $x \in \bigcup_{\alpha \in A} \uparrow E_{\alpha}$. Then there exists $\alpha_0 \in A$ such that $x \in \uparrow E_{\alpha_0}$. Exercise 2.2.3.14 implies that there exists $y \in E_{\alpha_0}$ such that $x \in \uparrow y$. Since

$$\{y\} \subset E_{\alpha_0}$$
$$\subset \bigcup_{\alpha \in A} E_{\alpha},$$

Exercise 2.2.3.12 implies that

$$x \in \uparrow y$$
$$\subset \uparrow \bigcup_{\alpha \in A} E_{\alpha}.$$

Since $x \in \bigcup_{\alpha \in A} \uparrow E_{\alpha}$ is arbitrary, we have that for each $x \in \bigcup_{\alpha \in A} \uparrow E_{\alpha}$, $x \in \uparrow \bigcup_{\alpha \in A} E_{\alpha}$. Hence $\bigcup_{\alpha \in A} \uparrow E_{\alpha} \subset \uparrow \bigcup_{\alpha \in A} E_{\alpha}$.

Since $\uparrow \bigcup_{\alpha \in A} E_{\alpha} \subset \bigcup_{\alpha \in A} \uparrow E_{\alpha}$ and $\bigcup_{\alpha \in A} \uparrow E_{\alpha} \subset \uparrow \bigcup_{\alpha \in A} E_{\alpha}$, we have that $\uparrow \bigcup_{\alpha \in A} E_{\alpha} = \bigcup_{\alpha \in A} \uparrow E_{\alpha}$.

2. Similar to (1).

Definition 2.2.3.16. Let (X, \leq) be a proset and $a \in X$. Then a is said to be

- \leq -maximal if for each $x \in X$, $a \leq x$ implies that $x \sim_{\leq} a$.
- \leq -minimal if for each $x \in X$, $x \leq a$ implies that $x \sim_{\leq} a$.

Note 2.2.3.17. When the context is clear, we write "maximal" and "minimal" instead of "\(\leq\)-maximal" and "\(\leq\)-minimal" respectively.

Exercise 2.2.3.18. Let (X, \leq) be a proset and $a \in X$. Then

- 1. a is maximal iff $\uparrow a = \pi_{X/\sim <}(a)$
- 2. a is minimal iff $\downarrow a = \pi_{X/\sim <}(a)$

Proof.

1. \bullet (\Longrightarrow):

Suppose that a is maximal.

- Let $x \in \uparrow a$. Exercise 2.2.3.11 implies $a \leq x$. Since a is maximal, $x \sim_{\leq} a$. Thus $x \in \pi_{X/\sim_{\leq}}(a)$. Since $x \in \uparrow a$ is arbitrary, we have that for each $x \in \uparrow a$, $x \in \pi_{X/\sim_{\leq}}(a)$. Hence $\uparrow a \subset \pi_{X/\sim_{\leq}}(a)$.
- Let $x \in \pi_{X/\sim_{\leq}}(a)$. Then $a \sim_{\leq} x$. Hence $a \leq x$ and $x \leq a$. Since $a \leq x$, we have that $x \in \uparrow a$. Since $x \in \pi_{X/\sim_{\leq}}(a)$ is arbitrary, we have that for each $x \in \pi_{X/\sim_{\leq}}(a)$, $x \in \uparrow a$. Hence $\pi_{X/\sim_{\leq}}(a) \subset \uparrow a$.

Since $\uparrow a \subset \pi_{X/\sim_{<}}(a)$ and $\pi_{X/\sim_{<}}(a) \subset \uparrow a$, we have that $\uparrow a = \pi_{X/\sim_{<}}(a)$.

(⇐=):

Suppose that $\uparrow a = \pi_{X/\sim_{<}}(a)$. Let $x \in X$. Suppose that $a \leq x$. Then

$$x \in \uparrow a$$
$$= \pi_{X/\sim_{<}}(a).$$

Thus $x \sim_{\leq} a$. Since $x \in X$ with $a \leq x$ is arbitrary, we have that for each $x \in X$, $a \leq x$ implies that $x \sim_{\leq} a$. Hence a is maximal.

2. Similar to (1).

Definition 2.2.3.19. Let (X, \leq) be a proset and $A \subset X$.

- Let $x \in X$. Then x is said to be a
 - $-\leq$ -upper bound of A if for each $a\in A, a\leq x$
 - \leq -lower bound of A if for each $a \in A$, $x \leq a$
- We define
 - $-\operatorname{ub}(A, \leq) := \{x \in X : x \text{ is a } \leq \text{-upper bound of } A\}$
 - $\operatorname{lb}(A, \leq) := \{x \in X : x \text{ is a } \leq \text{-lower bound of } A\}$
- \bullet Then A is said to be
 - \leq -bounded above if $ub(A, \leq) \neq \varnothing$
 - \leq -bounded below if $lb(A, \leq) \neq \varnothing$

Note 2.2.3.20. When the context is clear, we write

- "upper bound" and "lower bound" instead of "≤-upper bound" and "≤-lower bound" respectively
- ub A and lb A in place of ub(A, \leq) and lb(A, \leq) respectively
- "bounded above" and "bounded below" instead of "\(\leq\)-bounded above" and "\(\leq\)-bounded below" respectively

Exercise 2.2.3.21. Let (X, \leq) be a proset and $A \subset X$. Then

1.
$$\operatorname{ub} A = \bigcap_{x \in A} \uparrow x$$

2.
$$\operatorname{lb} A = \bigcap_{x \in A} \downarrow x$$

Proof.

- 1. Let $a \in \text{ub } A$ and $x \in A$. Then $x \leq a$. Hence $a \in \uparrow x$. Since $x \in A$ is arbitrary, we have that for each $x \in A$, $a \in \uparrow x$. Thus $a \in \bigcap_{x \in A} \uparrow x$. Since $a \in \text{ub } A$ is arbitrary, we have that for each $a \in \text{ub } A$, $a \in \bigcap_{x \in A} \uparrow x$. Hence $\text{ub } A \subset \bigcap_{x \in A} \uparrow x$.
 - Let $a \in \bigcap_{x \in A} \uparrow x$ and $x_0 \in A$. Then $a \in \uparrow x_0$. Hence $x_0 \leq a$. Since $x_0 \in A$ is arbitrary, we have that for each $x_0 \in A$, $x_0 \leq a$. Hence $a \in \text{ub } A$. Since $a \in \bigcap_{x \in A} \uparrow x$ is arbitrary, we have that for each $a \in \bigcap_{x \in A} \uparrow x$, $a \in \text{ub } A$. Thus $\bigcap_{x \in A} \uparrow x \subset \text{ub } A$.

Since $\operatorname{ub} A \subset \bigcap_{x \in A} \uparrow x$ and $\bigcap_{x \in A} \uparrow x \subset \operatorname{ub} A$, we have that $\operatorname{ub} A = \bigcap_{x \in A} \uparrow x$.

2. Similar to (1).

Definition 2.2.3.22. Let (X, \leq) be a proset and $A \subset X$.

- Let $x \in X$. Then x is said to be a
 - supremum of A or least upper bound of A, if
 - 1. $x \in \operatorname{ub} A$
 - 2. for each $y \in \text{ub } A$, $x \leq y$
 - infimum of A or greatest lower bound of A, denoted $x \in \inf A$, if
 - 1. $x \in lb A$

- 2. for each $y \in lb A$, $y \le x$.
- - We define $\sup A \subset X$ by $\sup A := \{x \in X : x \text{ is a supremum of } A\}$
 - We define $\inf A \subset X$ by $\inf A := \{x \in X : x \text{ is a infimum of } A\}$

Exercise 2.2.3.23. Let (X, \leq) be a poset and $A \subset X$. Then

- 1. for each $x, y \in \sup A$, $x \sim_{\leq} y$.
- 2. for each $x, y \in \inf A$, $x \sim_{\leq} y$.

Proof.

- 1. Let $x, y \in \sup A$. Then $x, y \in \operatorname{ub} A$. Since $x \in \sup A$ and $y \in \operatorname{ub} A$, $x \leq y$. Since $y \in \sup A$ and $x \in \operatorname{ub} A$, $y \leq x$. Hence $x \sim_{\leq} y$.
- 2. Similar to (1).

Exercise 2.2.3.24. Let (X, \leq) be a poset and $A \subset X$. Then

- 1. $\sup A = \operatorname{ub} A \cap \operatorname{lb}(\operatorname{ub} A)$
- 2. $\inf A = \operatorname{lb} A \cap \operatorname{ub}(\operatorname{lb} A)$

Proof.

1. We note that for each $x \in X$,

```
x \in \sup A \iff x \in \operatorname{ub} A \text{ and for each } y \in \operatorname{ub} A, \ x \leq y
\iff x \in \operatorname{ub} A \text{ and } x \in \operatorname{lb}(\operatorname{ub} A)
\iff x \in \operatorname{ub} A \cap \operatorname{lb}(\operatorname{ub} A).
```

Therefore $\sup A = \operatorname{ub} A \cap \operatorname{lb}(\operatorname{ub} A)$.

2. Similar to (1).

2.2.4 Order Preserving Maps

Definition 2.2.4.1. Let (X, \leq_X) (Y, \leq_Y) be prosets and $f: X \to Y$. Then f is said to be

- (\leq_X, \leq_Y) -order preserving or (\leq_X, \leq_Y) -monotone if for each $a, b \in X$, $a \leq_X b$ implies that $f(a) \leq_Y f(b)$.
- (\leq_X, \leq_Y) -order reversing or (\leq_X, \leq_Y) -antitone if for each $a, b \in X$, $a \leq_X b$ implies that $f(b) \leq_Y f(a)$.

Note 2.2.4.2. When the context is clear we say that f is "monotone" and "antitone" instead of " (\leq_X, \leq_Y) -monotone" and " (\leq_X, \leq_Y) -antitone" respectively.

Exercise 2.2.4.3. Let (X, \leq_X) (Y, \leq_Y) be prosets and $f: X \to Y$. Then

- 1. the folloing are equivalent:
 - (a) f is (\leq_X, \leq_Y) -antitone
 - (b) f is $(\leq_X, \leq_Y^{\text{op}})$ -monotone
 - (c) f is $(\leq_X^{\text{op}}, \leq_Y)$ -monotone
 - (d) f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -antitone
- 2. the folloing are equivalent:

- (a) f is (\leq_X, \leq_Y) -monotone
- (b) f is (\leq_X, \leq_Y^{op}) -antitone
- (c) f is $(\leq_X^{\text{op}}, \leq_Y)$ -antitone
- (d) f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -monotone

Proof.

1. • $(a) \Longrightarrow (b)$: Suppose that f is (\leq_X, \leq_Y) -antitone. Let $a, b \in X$. Then

$$a \leq_X b \implies f(b) \leq_Y f(a)$$

 $\iff f(a) \leq_V^{\text{op}} f(b).$

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X b$ implies that $f(a) \leq_Y^{\text{op}} f(b)$. Hence f is $(\leq_X, \leq_Y^{\text{op}})$ -monotone.

• $(b) \implies (c)$: Suppose that f is $(\leq_X, \leq_Y^{\text{op}})$ -monotone. Let $a, b \in X$. Then

$$\begin{array}{ccc} a \leq_X^{\operatorname{op}} b & \Longleftrightarrow & b \leq_X^{\operatorname{op}} a \\ & \Longrightarrow & f(b) \leq_Y^{\operatorname{op}} f(a) \\ & \Longleftrightarrow & f(a) \leq_Y f(b). \end{array}$$

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X^{\text{op}} b$ implies that $f(a) \leq_Y f(b)$. Hence f is $(\leq_X^{\text{op}}, \leq_Y)$ -monotone.

• $(c) \implies (d)$: Suppose that f is $(\leq_X^{\text{op}}, \leq_Y)$ -monotone. Let $a, b \in X$. Then

$$a \leq_X^{\text{op}} b \implies f(a) \leq_Y f(b)$$

 $\iff f(b) \leq_Y^{\text{op}} f(a).$

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X^{\text{op}} b$ implies that $f(b) \leq_Y^{\text{op}} f(a)$. Hence f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -antitone.

• $(d) \Longrightarrow (a)$: Suppose that f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -antitone. Let $a, b \in X$. Then

$$a \leq_X b \iff b \leq_X^{\text{op}} a$$
$$\implies f(a) \leq_Y^{\text{op}} f(b)$$
$$\iff f(b) \leq_Y f(a).$$

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X b$ implies that $f(b) \leq_Y f(a)$. Hence f is (\leq_X, \leq_Y) -antitone.

2. Set $\leq_Y' := \leq_Y^{op}$. Part (1) implies that

$$f$$
 is $(\leq_X, (\leq'_Y)^{\operatorname{op}})$ -monotone $\iff f$ is (\leq_X, \leq'_Y) -antitone (by $1(b) \iff 1(a)$)
 $\iff f$ is $(\leq_X^{\operatorname{op}}, (\leq'_Y)^{\operatorname{op}})$ -antitone (by $1(a) \iff 1(d)$)
 $\iff f$ is $(\leq_X^{\operatorname{op}}, \leq'_Y)$ -monotone (by $1(d) \iff 1(c)$).

Since $(\leq'_Y)^{\text{op}} = \leq_Y$, we have that

$$f$$
 is (\leq_X, \leq_Y) -monotone $\iff f$ is $(\leq_X, \leq_Y^{\text{op}})$ -antitone $\iff f$ is $(\leq_X^{\text{op}}, \leq_Y)$ -antitone $\iff f$ is $(\leq_Y^{\text{op}}, \leq_Y^{\text{op}})$ -monotone.

Exercise 2.2.4.4. Let (X, \leq_X) (Y, \leq_Y) be prosets and $f: X \to Y$. Then f is (\leq_X, \leq_Y) -monotone iff f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -monotone.

Proof.

• (⇒):

Suppose that f is (\leq_X, \leq_Y) -monotone. Let $a, b \in X$. Suppose that $a \leq_X^{\text{op}} b$. Then $b \leq_X a$. Hence $f(b) \leq_Y f(a)$. Thus $f(a) \leq_Y^{\text{op}} f(b)$. Since $a, b \in X$ with $a \leq_X^{\text{op}} b$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X^{\text{op}} b$ implies that $f(a) \leq_Y^{\text{op}} f(b)$. Therefore f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -monotone.

• (\Leftarrow): Suppose that f is $(\leq_X^{\text{op}}, \leq_Y^{\text{op}})$ -monotone. Since $(\leq_X^{\text{op}})^{\text{op}} = \leq_X$, the previous part implies that f is (\leq_X, \leq_Y) -monotone.

Exercise 2.2.4.5. Let (X, \leq_X) (Y, \leq_Y) be prosets and $f: X \to Y$. Then for each $U \subset Y$, U is a \leq_Y -upper set implies that $f^{-1}(U)$ is a \leq_X -upper set iff for each $L \subset Y$, L is a \leq_Y -lower set implies that $f^{-1}(L)$ is a \leq_X -lower set.

Proof.

• (⇒⇒):

Suppose that for each $U \subset Y$, U is a \leq_Y -upper set implies that $f^{-1}(U)$ is a \leq_X -upper set. Let $L \subset Y$. Suppose that L is a \leq_Y -lower set. Exercise 2.2.3.5 then implies that L^c is a \leq_Y -upper set. By assumption, $f^{-1}(L^c)$ is a \leq_X -upper set. Another application of Exercise 2.2.3.5 implies that $f^{-1}(L^c)^c$ is a \leq_X -lower set. Since

$$f^{-1}(L) = [f^{-1}(L)^c]^c$$

= $f^{-1}(L^c)^c$,

we have that $f^{-1}(L)$ is a \leq_X -lower set. Since $L \subset Y$ such that L is a \leq_Y -lower set is arbitrary, we have that for each $L \subset Y$, L is a \leq_Y -lower set implies that $f^{-1}(L)$ is a \leq_X -lower set.

• (\Leftarrow) : Similar to (\Longrightarrow) .

Exercise 2.2.4.6. Let (X, \leq_X) (Y, \leq_Y) be prosets and $f: X \to Y$. If f is (\leq_X, \leq_Y) -monotone, then for each $U \subset Y$, U is a \leq_Y -upper set implies that $f^{-1}(U)$ is a \leq_X -upper set.

Proof. Suppose that f is (\leq_X, \leq_Y) -monotone. Let $U \subset Y$. Suppose that U is a \leq_Y -upper set. Let $a \in f^{-1}(U)$ and $x \in X$. Suppose that $a \leq x$. Since $a \in f^{-1}(U)$, $f(a) \in U$. Since f is monotone, $f(a) \leq f(x)$. Since U is a \leq_Y -upper set and $f(a) \in U$, we have that $f(x) \in U$. Hence $x \in f^{-1}(U)$. Since $a \in f^{-1}(U)$ and $x \in X$ with $a \leq x$ are arbitrary, we have that for each $a \in f^{-1}(U)$ and $x \in X$, $a \leq x$ implies that $x \in f^{-1}(U)$. Thus $f^{-1}(U)$ is a \leq_X -upper set. Since $U \subset Y$ such that U is a \leq_Y -upper set is arbitrary, we have that for each $U \subset Y$, U is a \leq_Y -upper set implies that $f^{-1}(U)$ is a \leq_X -upper set. \square

Exercise 2.2.4.7. Let (X, \leq_X) (Y, \leq_Y) be prosets, $f: X \to Y$ and $A \subset X$. If f is (\leq_X, \leq_Y) -monotone, then $f(\text{ub}(A, \leq_X)) \subset \text{ub}(f(A), \leq_Y)$.

Proof. Suppose that f is (\leq_X, \leq_Y) -monotone. Let $x \in \text{ub}(A, \leq_X)$ and $y_0 \in f(A)$. Then there exists $x_0 \in A$ such that $f(x_0) = y$. Since $x \in \text{ub}(A, \leq_X)$, $x_0 \leq x$. Since f is (\leq_X, \leq_Y) -monotone,

$$y_0 = f(x_0)$$

$$\leq f(x).$$

Since $y_0 \in f(A)$ is arbitrary, we have that for each $y_0 \in f(A)$, $y_0 \le f(x)$. Therefore $f(x) \in \text{ub}(F(A), \le_Y)$. Since $x \in \text{ub}(A, \le_X)$ is arbitrary, we have that for each $x \in \text{ub}(A, \le_X)$, $f(x) \in \text{ub}(F(A), \le_Y)$. Hence $f(\text{ub}(A, \le_X)) \subset \text{ub}(f(A), \le_Y)$.

2.2.5 Galois Connections

Definition 2.2.5.1. Let (X, \leq_X) and (Y, \leq_Y) be prosets, $f: X \to Y$ and $g: Y \to X$.

• Then (f,g) is said to be a (\leq_X,\leq_Y) -monotone Galois connection if for each $x\in X$ and $y\in Y$,

$$f(x) \leq_Y y \text{ iff } x \leq_X g(y).$$

• Then (f,g) is said to be a (\leq_X,\leq_Y) -antitone Galois connection if for each $x\in X$ and $y\in Y$,

$$f(x) \leq_Y y \text{ iff } g(y) \leq_X x.$$

Note 2.2.5.2. When the context is clear, we say "monotone (resp. antitone) Galois connection" instead of " (\leq_X, \leq_Y) -monotone (resp. (\leq_X, \leq_Y) -antitone) Galois connection".

Definition 2.2.5.3. Let (X, \leq_X) and (Y, \leq_Y) be prosets, $f: X \to Y$ and $g: Y \to X$. If (f, g) is a monotone (resp. antitone) Galois connection, then

- f is said to be a **left adjoint** of g,
- g is said to be a **right adjoint** of f.

Exercise 2.2.5.4. Let (X, \leq_X) and (Y, \leq_Y) be prosets, $f: X \to Y$ and $g: Y \to X$. Then

- 1. (f,g) is a (\leq_X,\leq_Y) -monotone Galois connection iff (g,f) is a $(\leq_Y^{\text{op}},\leq_X^{\text{op}})$ -monotone Galois connection
- 2. (f,g) is a (\leq_X,\leq_Y) -antitone Galois connection iff (f,g) is a $(\leq_X^{\text{op}},\leq_Y)$ -monotone Galois connection

Proof.

1. • (\Longrightarrow): Suppose that (f,g) is a (\leq_X,\leq_Y) -monotone Galois connection. Let $y\in Y$ and $x\in X$. By assumption,

$$g(y) \leq_X^{\text{op}} x \iff x \leq_X g(y)$$
$$\iff f(x) \leq_Y y$$
$$\iff y \leq_V^{\text{op}} f(x).$$

Since $y \in Y$ and $x \in X$ are arbitrary, we have that for each $y \in Y$ and $x \in X$, $g(y) \leq_X^{\text{op}} x$ iff $y \leq_Y^{\text{op}} f(x)$. Therefore (g, f) is a $(\leq_Y^{\text{op}}, \leq_X^{\text{op}})$ -monotone Galois connection.

- (⇐=):
- $2. \qquad \bullet \ (\Longrightarrow): \\ \text{FINISH!!!}$
 - (⇐=):

Exercise 2.2.5.5. Let (X, \leq_X) and (Y, \leq_Y) be prosets, $f: X \to Y$ and $g: Y \to X$. Then (f, g) us a (\leq_X, \leq_Y) -monotone Galois connection iff

- 1. (a) for each $x \in X$, $x \leq_X g \circ f(x)$
 - (b) for each $y \in Y$, $f \circ g(y) \leq_Y y$
- 2. f is (\leq_X, \leq_Y) -monotone and g is (\leq_Y, \leq_X) -monotone

Proof.

- (⇒⇒):
 - 1. (a) Let $x \in X$. Define $y \in Y$ by y := f(x). Since $f(x) \leq_Y f(x)$, we have that $f(x) \leq_Y y$. Therefore

$$x \leq_X g(y)$$

= $g \circ f(x)$.

Since $x \in X$ is arbitrary, we have that for each $x \in X$, $x \leq_X g \circ f(x)$.

- (b) Let $y \in Y$. the previous ex implies that (g, f) is a $(\leq_Y^{\text{op}}, \leq_X^{\text{op}})$ -monotone Galois connection. Part 1(a) then implies that for each $y \in Y$, $y \leq_Y^{\text{op}} f \circ g(y)$. Therefore for each $y \in Y$, $f \circ g(y) \leq_Y y$
- 2. Let $a, b \in X$. Define $x \in X$ and $y \in Y$ by x := a and y := f(b). Suppose that $a \leq_X b$. Part 1(a) implies that

$$x = a$$

$$\leq_X b$$

$$\leq_X g(f(x))$$

$$= g(y).$$

Since (f,g) is a (\leq_X,\leq_Y) -monotone Galois connection, we have that

$$f(a) = f(x)$$

$$\leq y$$

$$= f(b).$$

Since $a, b \in X$ with $a \leq_X b$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X b$ implies that $f(a) \leq_Y f(b)$. Thus f is (\leq_X, \leq_Y) -monotone.

- Since (f,g) is a (\leq_X, \leq_Y) -monotone Galois connection, a previous ex implies that (g,f) is a $(\leq_Y^{\text{op}}, \leq_X^{\text{op}})$ -monotone Galois connection. The previous part implies that g is $(\leq_Y^{\text{op}}, \leq_X^{\text{op}})$ -monotone. Exercise 2.2.4.3 then implies that g is (\leq_Y, \leq_X) -monotone.

• (⇐=): FINISH!!!

Exercise 2.2.5.6. Let (X, \leq_X) and (Y, \leq_Y) be prosets and (f, g) a (\leq_X, \leq_Y) -monotone Galois connection. Then $f = f \circ g \circ f$ and $g = g \circ f \circ g$.

Proof. FINSIH!!

Exercise 2.2.5.7. Let (X, \leq) be a proset. Define $F, G : \mathcal{P}(X) \to \mathcal{P}(X)$ by F(A) := ub A and G(A) := lb A. Then (F, G) is a (\subset, \subset) -monotone Galois connection.

Proof. FINISH!!!

2.3 Posets

2.3.1 Introduction

Definition 2.3.1.1. Poset:

Let X be a set and $\leq \subset X \times X$ a binary relation on X. Then

- \leq is said to be a **partial order on** X if
 - 1. \leq is a preorder on X
 - 2. for each $a, b \in X$, $a \le b$ and $b \le a$ implies that a = b,
- (X, \leq) is (X, \leq) is said to be a **partially ordered set** or **poset** if \leq is a partial ordering on X.

Exercise 2.3.1.2. Let (X, \leq) be a poset and $a, b \in X$. Then $a \sim_{\leq} b$ iff a = b.

Proof.

- (\Longrightarrow): Suppose that $a \sim_{\leq} b$. Then $a \leq b$ and $b \leq a$. Since \leq is a partial order, a = b.
- (\iff): Since \sim_{\leq} is reflexive, a=b implies that $a\sim_{\leq}b$.

Definition 2.3.1.3. Let (X, \leq_X) be a proset. Set $Y := X/\sim_{\leq_X}$. We define $\leq_Y \subset Y \times Y$ by $y_1 \leq_Y y_2$ iff there exists $x_1 \in y_1$ and $x_2 \in y_2$ such that $x_1 \leq_X x_2$.

Exercise 2.3.1.4. Let (X, \leq_X) be a proset. Set $Y := X/\sim_{\leq_X}$. Then (Y, \leq_Y) is a poset.

Proof.

- 1. (a) Let $y \in Y$. Then there exists $x \in y$. Since $x \leq_X x$, we have that $y \leq_Y y$.
 - (b) Let $y_1, y_2, y_3 \in Y$. Suppose that $y_1 \leq_Y y_2$ and $y_2 \leq_Y y_3$. Then there exist $x_1 \in y_1, x_2 \in y_2$ and $x_3 \in y_3$ such that $x_1 \leq_X x_2$ and $x_2 \leq_X x_3$. Therefore $x_1 \leq x_3$. Hence $y_1 \leq_Y y_3$.

Thus \leq_Y is a preorder on Y.

2. Let $y_1, y_2 \in Y$. Suppose that $y_1 \leq_Y y_2$ and $y_2 \leq_Y y_1$. Then there exist $a_1, b_1 \in y_1$, $a_2, b_2 \in y_2$ such that $a_1 \leq_X a_2$ and $b_2 \leq_X b_1$. Since $a_1, b_1 \in y_1$ and $a_2, b_2 \in y_2$, $a_1 \sim_{\leq_X} b_1$ and $a_2 \sim_{\leq_X} b_2$. Thus

$$a_1 \leq_X a_2$$
$$\leq_X b_2.$$

and

$$b_2 \le_X b_1$$
$$\le_X a_1.$$

Hence $a_1 \sim_{\leq_X} b_2$ and

$$y_1 = \pi(a_1)$$
$$= \pi(b_2)$$
$$= y_2.$$

Therefore \leq_Y is a partial order on Y.

Exercise 2.3.1.5. Let (X, \leq) be a poset and $A \subset X$. Then

2.3. POSETS

23

- 1. for each $x, y \in \sup A$, x = y.
- 2. for each $x, y \in \inf A$, x = y.

Proof.

- 1. Let $x, y \in \sup A$. Exercise 2.2.3.23 implies that $x \sim y$. Exercise 2.3.1.2 then implies that x = y.
- 2. Similar to (1).

Definition 2.3.1.6. Let (X, \leq) be a poset and $A \subset X$.

- We say that sup A (resp. inf A) exists if sup $A \neq \emptyset$ (resp. inf $A \neq \emptyset$).
- Let $x \in X$. We write $x = \sup A$ (resp. $x = \inf A$) if $x \in \sup A$ (resp. $x \in \inf A$)

Exercise 2.3.1.7. Let (X, \leq) be a poset and $A \subset X$. Then

- 1. $\sup A = \inf(\operatorname{ub} A)$ in proset subsection, make exercise saying $\sup A = \operatorname{ub} A \cap \operatorname{lb}(\operatorname{ub} A)$, then rework this exercise with this fact to shorten it up, show $A \mapsto \operatorname{ub} A$ and $A \mapsto \operatorname{lb} A$ make a galois connection, then $\operatorname{ub}(\operatorname{lb}(\operatorname{ub} A)) = \operatorname{ub} A$ and this implies that $\sup A = \inf(\underline{A})$ and dually, in prosets (i.e. make exercises in proset sections)
- 2. $\inf A = \sup(\operatorname{lb} A)$

Proof.

- 1. Exercise 2.2.3.24 implies that $\sup A \in \operatorname{ub} A \cap \operatorname{lb}(\operatorname{ub} A)$.
 - By definition, for each $x \in \text{ub } A$, $\sup A \leq x$. Therefore $\sup A \in \text{lb}(\text{ub } A)$. Hence $\sup A \leq \inf(\text{ub } A)$.
 - By definition, $\sup A \in \operatorname{ub} A$ and $\inf(\operatorname{ub} A) \in \operatorname{lb}(\operatorname{ub} A)$. Therefore $\inf(\operatorname{ub} A) \leq \sup A$.

Since $\sup A \leq \inf(\operatorname{ub} A)$ and $\inf(\operatorname{ub} A) \leq \sup A$, we have that $\sup A = \inf(\operatorname{ub} A)$.

2. Similar to (1).

Exercise 2.3.1.8. Associativity of Supremum:

Let (X, \leq) be a poset and $(E_{\alpha})_{\alpha \in A} \subset \mathcal{P}(X)$.

- 1. Suppose that
 - for each $\alpha \in A$, sup E_{α} exists
 - $\sup_{\alpha \in A} \left[\sup E_{\alpha} \right]$ exists.

Then

$$\sup \bigcup_{\alpha \in A} E_{\alpha} = \sup_{\alpha \in A} \left[\sup E_{\alpha} \right]$$

- 2. Suppose that
 - for each $\alpha \in A$, inf E_{α} exists
 - $\inf_{\alpha \in A} \left[\inf E_{\alpha} \right]$ exists.

Then

$$\inf \bigcup_{\alpha \in A} E_{\alpha} = \inf_{\alpha \in A} \left[\inf E_{\alpha} \right]$$

Proof.

- 1. Define $s_1, s_2 \in X$ by $s_1 := \bigcup_{\alpha \in A} E_\alpha$ and $s_2 := \sup_{\alpha \in A} \left[\sup E_\alpha \right]$. We note by definition, s_2 is an upper bound for $\{\sup E_\alpha : \alpha \in A\}$. Then for each $\alpha \in A$, $s_2 \ge \sup E_\alpha$.
 - Let $x \in \bigcup_{\alpha \in A} E_{\alpha}$. Then there exists $\alpha_0 \in A$ such that $x \in E_{\alpha_0}$. Since $\sup E_{\alpha_0}$ is an upper bound of E_{α_0} , we have that

$$s_2 \ge \sup E_{\alpha_0}$$
$$\ge x.$$

Since $x \in \bigcup_{\alpha \in A} E_{\alpha}$ is arbitrary, we have that s_2 is an upper bound for $\bigcup_{\alpha \in A} E_{\alpha}$. Therefore

$$s_1 = \sup \bigcup_{\alpha \in A} E_{\alpha}$$
$$\leq s_2.$$

• Let $\alpha_0 \in A$ and $x \in E_{\alpha_0}$. Then

$$x \in E_{\alpha_0}$$

$$\subset \bigcup_{\alpha \in A} E_{\alpha}.$$

Since s_1 is an upper bound of $\bigcup_{\alpha \in A} E_{\alpha}$, we have that $s_1 \geq x$. Since $x \in E_{\alpha_0}$ is arbitrary, we have that for each $x \in E_{\alpha_0}$, $s_1 \geq x$. Hence s_1 is an upper bound of E_{α_0} . Therefore $\sup E_{\alpha_0} \leq s_1$. Since $\alpha_0 \in A$ is arbitrary, we have that for each $\alpha \in A$, $s_1 \geq \sup E_{\alpha}$. Therefore s_1 is an upper bound of $\sup E_{\alpha} : \alpha \in A$. Hence

$$s_2 = \sup_{\alpha \in A} \left[\sup E_\alpha \right]$$

< s_1 .

Since $s_1 \leq s_2$ and $s_2 \leq s_1$, we have that $s_1 = s_2$.

2. Similar to (1). Maybe fill out

Exercise 2.3.1.9. Let (X, \leq) be a poset and $a, b \in X$. Then $a \leq b$ iff $b = \sup\{a, b\}$.

Proof.

• (⇒):

Suppose that $a \leq b$. Since $b \leq b$, we have that for each $c \in \{a,b\}$, $c \leq b$. Hence $b \in \text{lb}\{a,b\}$. Let $c \in \text{ub}\{a,b\}$. Then $b \leq c$. Since $c \in \text{ub}\{a,b\}$ is arbitrary, we have that for each $c \in \text{ub}\{a,b\}$, $b \leq c$. Hence $b = \sup\{a,b\}$.

• (\Leftarrow): Suppose that $b = \sup\{a, b\}$. Then $b \in \text{ub}\{a, b\}$. Therefore $a \leq b$.

Exercise 2.3.1.10. Let (X, \leq) be a poset. Then

- 1. for each $a, b \in \text{ub } X$, a = b,
- 2. for each $a, b \in lb X$, a = b.

Proof.

- 1. Let $a, b \in \text{ub } X$. Since $a \in X$ and $b \in \text{ub } X$, $a \leq b$. Similarly, $b \leq a$. Hence a = b.
- 2. Similar to (1).

2.4. DIRECTED SETS 25

2.4 Directed Sets

Definition 2.4.0.1. Directed Set:

Let A be a set and $\leq \subset A \times A$ a binary relation on A. Then

- \leq is said to be a **direction on** A if
 - 1. \leq is a preorder on A
 - 2. for each $\alpha, \beta \in A$, $\{\alpha, \beta\}$ is bounded above.
- (A, \leq) is said to be a **directed set** if
 - 1. $A \neq \emptyset$
 - 2. \leq is a direction on A

Exercise 2.4.0.2. Let (A, \leq_A) and (B, \leq_B) be directed sets. Then

- 1. $\leq_A \otimes \leq_B$ is a direction on $A \times B$,
- 2. $(A, \leq_A) \otimes (B, \leq_B)$ is a directed set.

Proof.

- 1. (a) Exercise ?? implies that $\leq_A \otimes \leq_B$ is a preorder of $A \times B$.
 - (b) Let $(a_1, b_1), (a_2, b_2) \in A \times B$. Then there exist $a \in A$ and $b \in B$ such that $a_1, a_2 \leq_A a$ and $b_1, b_2 \leq_B b$. Hence $(a_1, b_1), (a_2, b_2) \leq_A \otimes \leq_B (a, b)$.

Hence $\leq_A \otimes \leq_B$ is a direction on $A \times B$.

- 2. (a) Since $A \neq \emptyset$ and $B \neq \emptyset$, we have that $A \times B \neq \emptyset$.
 - (b) From above, $\leq_A \otimes \leq_B$ is a direction on $A \times B$.

Hence $(A \times B, \leq_A \otimes \leq_B)$ is a directed set.

Chapter 3

Lattices

3.1Introduction

Skew Semilattices

cite Leech, skew lattices in rings

Definition 3.1.1.1. Let X be a set and $\diamond: X \times X \to X$ a binary operator on X. Then

- \diamond is said to be a **skew semilattice operator on** X if \diamond is associative and idempotent.
- (X, \diamond) is said to be a **skew semilattice** if \diamond is a skew semilattice operator on X.

Definition 3.1.1.2. Let (X,\diamond) be an skew semilattice. We define the

- join preorder on X induced by \diamond , denoted $\leq^\vee_\diamond \subset X \times X$, by $a \leq^\vee_\diamond b$ iff $(b \diamond a) \diamond b = b$
- meet preorder on X induced by \diamond , denoted $\leq_{\diamond}^{\wedge} \subset X \times X$, by $a \leq_{\diamond}^{\wedge} b$ iff $(a \diamond b) \diamond a = a$.

Exercise 3.1.1.3. Let (X, \diamond) be an skew semilattice. Then

1. \leq^{\vee}_{\diamond} is a preorder on X. **Hint:** If cbc = c and bab = b, then

- (a) c = (cb)(abc)(abc) and c = cabc
- (b) cac = (ca)(ca)(bc)
- 2. \leq^{\wedge}_{\diamond} is a preorder on X.

Proof.

- 1. Let $a, b, c \in X$.
 - (a) Since \diamond is idempotent, we have that

$$(a \diamond a) \diamond a = a \diamond a$$
$$= a$$

and therefore $a \leq^{\vee}_{\diamond} a$.

(b) Suppose that $a \leq^\vee_{\diamond} b$ and $b \leq^\vee_{\diamond} c$. Then $(b \diamond a) \diamond b = b$ and $(c \diamond b) \diamond c = c$. Since \diamond is associative and idempotent,

$$c = cbc$$

$$= cbabc$$

$$= (cb)(abc)$$

$$= (cb)(abc)(abc)$$

$$= c(bab)cabc$$

$$= cbcabc$$

$$= (cbc)abc$$

$$= cabc.$$

Therefore

$$cac = (ca)(c)$$

$$= (ca)(cabc)$$

$$= (ca)(ca)(bc)$$

$$= (ca)(bc)$$

$$= cabc$$

$$= c.$$

Hence $a \leq^{\vee}_{\diamond} c$.

So \leq^{\vee}_{\diamond} is a preorder on X.

2. Similar to (1).

Exercise 3.1.1.4. Let (X, \diamond) be an skew semilattice. Then

- 1. $(\leq^{\vee})^{\mathrm{op}} = \leq^{\wedge}$
- 2. $(\leq_{\diamond}^{\wedge})^{\mathrm{op}} = \leq_{\diamond}^{\vee}$

Proof.

1. Let $a, b \in X$. Then

$$a(\leq^{\vee}_{\diamond})^{\mathrm{op}}b\iff b\leq^{\vee}_{\diamond}a$$
$$\iff a\diamond b\diamond a=a$$
$$\iff a\leq^{\wedge}_{\diamond}b.$$

2. Similar to (1).

Exercise 3.1.1.5. Let (X, \diamond) be an skew semilattice. Then for each $a, b \in X$,

- 1. $a \diamond b \in \text{ub}(\{a, b\}, \leq^{\vee}_{\diamond})$
- 2. $a \diamond b \in \text{lb}(\{a,b\},\leq^{\wedge}_{\diamond})$

Proof. Let $a, b \in X$.

3.1. INTRODUCTION

31

1. We note that

$$(a \diamond b) \diamond [a \diamond (a \diamond b)] = (a \diamond b) \diamond [(a \diamond a) \diamond b]$$
$$= (a \diamond b) \diamond (a \diamond b)$$
$$= a \diamond b.$$

Similarly, $[(a \diamond b) \diamond b] \diamond (a \diamond b) = a \diamond b$. Therefore $a \leq^\vee_{\diamond} a \diamond b$ and $b \leq^\vee_{\diamond} a \diamond b$. Hence $a \diamond b \in \text{ub}(\{a,b\},\leq^\vee_{\diamond})$.

2. FINISH!!!

Definition 3.1.1.6. Let X be a set and \vee , \wedge skew semilattice operators on X. Then \vee and \wedge are said to **satisfy the skew** lattice absorption identities if for each $a, b \in X$,

- 1. $a \wedge (a \vee b) = a$
- $2. \ a \lor (a \land b) = a$
- 3. $(b \lor a) \land a = a$
- 4. $(b \wedge a) \vee a = a$

Exercise 3.1.1.7. Let X be a set and \vee , \wedge skew semilattice operators on X. Then \vee and \wedge satisfy the skew lattice absorption identities iff for each $a, b \in X$,

- 1. $a \lor b = b$ iff $a \land b = a$
- 2. $a \lor b = a$ iff $a \land b = b$

Proof.

• (⇒):

Suppose that \vee and \wedge satisfy the skew lattice absorption identities. Let $a, b \in X$.

1. $- (\Longrightarrow)$: If $a \lor b = b$, then

$$a \wedge b = a \wedge (a \vee b)$$
$$= a.$$

$$- (\Leftarrow)$$
:
If $a \wedge b = a$, then

$$a \lor b = (a \land b) \lor b$$
$$= b.$$

Thus $a \lor b = b$ iff $a \land b = a$.

- 2. Similar to (1)
- (<==):

Suppose that for each $a, b \in X$,

- 1. $a \lor b = b$ iff $a \land b = a$.
- 2. $a \lor b = a$ iff $a \land b = b$.

Let $a, b \in X$.

1. Set $c := a \vee b$. By assumption,

$$a \wedge (a \vee b) = a \iff a \wedge c = a$$

$$\iff a \vee c = c$$

$$\iff a \vee (a \vee b) = c$$

$$\iff (a \vee a) \vee b = c$$

$$\iff a \vee b = c$$

$$\iff c = c.$$

Since c = c, we have that $a \wedge (a \vee b) = a$.

- 2. Similar to (1)
- 3. Similar to (1)
- 4. Similar to (1)

Exercise 3.1.1.8. Let X be a set and \vee , \wedge skew semilattice operators on X. If \vee and \wedge satisfy the skew lattice absorption identities, then for each $a, b \in X$, $b \vee a \vee b = b$ iff $a \wedge b \wedge a = a$.

Hint: Exercise 3.1.1.7 implies that $b \lor (a \lor b) = b$ iff $b \land (a \lor b) = a \lor b$. Use, skew lattice absorption identities and associativity.

Proof. Suppose that \vee and \wedge satisfy the skew lattice absorption identities. Let $a, b \in X$.

(⇒⇒):

Suppose that $b \lor a \lor b = b$. Then Exercise 3.1.1.7 implies that $b \land (a \lor b) = (a \lor b)$. Therefore

$$a \wedge b = (a \wedge b) \vee [(a \wedge b) \wedge (a \vee b)]$$
 (absorption)
= $(a \wedge b) \vee [a \wedge (b \wedge [a \vee b])]$ (associativity)
= $(a \wedge b) \vee [a \wedge (a \vee b)]$ (from earlier)
= $(a \wedge b) \vee a$ (absorption).

Another application of Exercise 3.1.1.7 implies that $(a \wedge b) \wedge a = a$.

• (\Leftarrow) : Similar to (\Longrightarrow) .

3.1.2 Skew lattices

Definition 3.1.2.1. Let X be a set and \vee , \wedge skew semilattice operators on X. Then (X, \vee, \wedge) is said to be a **skew lattice** if \vee and \wedge satisfy the skew lattice absorption identities.

Exercise 3.1.2.2. Let (X, \vee, \wedge) be an skew lattice. Then

- 1. $\leq^{\vee}_{\vee} = \leq^{\wedge}_{\wedge}$.
- $2. \leq^{\wedge}_{\vee} = \leq^{\vee}_{\wedge} = (\leq^{\vee}_{\vee})^{\mathrm{op}}.$

Proof.

1. Let $a, b \in X$. Since (X, \vee, \wedge) is an skew lattice, \vee and \wedge satisfy the skew lattice absorption identities. Exercise 3.1.1.8 then implies that

$$\begin{array}{ll} a \leq^\vee_\vee b \iff b \vee a \vee b = b \\ \iff a \wedge b \wedge a = a \\ \iff a <^\wedge_\wedge b. \end{array}$$

Since $a,b\in X$ are arbitrary, we have that for each $a,b\in X,\,a\leq^\vee_\vee b$ iff $a\leq^\wedge_\wedge b$. Hence $\leq^\vee_\vee=\leq^\wedge_\wedge.$

3.1. INTRODUCTION 33

2. Exercise 3.1.1.4 and part (1) imply that

$$\leq^{\wedge}_{\vee} = (\leq^{\vee}_{\vee})^{\mathrm{op}}$$
$$= (\leq^{\wedge}_{\wedge})^{\mathrm{op}}$$
$$= \leq^{\vee}_{\wedge}.$$

Note 3.1.2.3. Let (X, \vee, \wedge) be an skew lattice. When the context is clear, we write \leq in place of \leq^{\vee}_{\vee} .

3.1.3 Semilattices

Definition 3.1.3.1. Let X be a set and $\diamond: X \times X \to X$. Then

- \diamond is said to be a **semilattice operator on** X if \diamond associative, idempotent and commutative.
- (X,\diamond) is said to be an **semilattice** if \diamond is a semilattice operator on X.

Exercise 3.1.3.2. Let X be a set and $\diamond: X \times X \to X$. Then \diamond is a semilattice operator on X iff

- 1. \diamond is a skew semilattice operator on X,
- $2. \diamond is commutative.$

Proof. Clear by definition.

Exercise 3.1.3.3. Let (X, \diamond) be a semilattice. Then

1. for each $a, b \in X$,

(a)
$$a \leq^{\vee}_{\diamond} b \text{ iff } a \diamond b = b$$

(b)
$$a \leq^{\wedge}_{a} b$$
 iff $a \diamond b = a$

- 2. (a) \leq^{\vee}_{\diamond} is a partial order on X
 - (b) \leq^{\wedge}_{\diamond} is a partial order on X

Proof.

- 1. Let $a, b \in X$.
 - (a) Since \diamond is commutative, associative and idempotent,

$$\begin{array}{ll} a \leq^\vee_{\diamond} b \iff (b \diamond a) \diamond b = b \\ \iff (a \diamond b) \diamond b = b \\ \iff a \diamond (b \diamond b) = b \\ \iff a \diamond b = b. \end{array}$$

CHAPTER 3. LATTICES

- (b) Similar to 1(a).
- 2. (a) Exercise 3.1.1.3 implies that \leq^\vee_{\diamond} is a preorder on X. Let $a,b\in X$. Suppose that $a\leq^\vee_{\diamond} b$ and $b\leq^\vee_{\diamond} a$. Part (1) then implies that $a\diamond b=b$ and $b\diamond a=a$. Since \diamond is commutative,

$$a = b \diamond a$$
$$= a \diamond b$$
$$= b.$$

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, if $a \leq^{\vee}_{\diamond} b$ and $b \leq^{\vee}_{\diamond} a$, then a = b. Thus \leq^{\vee}_{\diamond} is a a partial order on X.

(b) Similar to 2(a).

Exercise 3.1.3.4. Let (X,\diamond) be a semilattice. Then for each $a,b\in X$,

1.
$$a \diamond b = \sup(\{a, b\}, \leq^{\vee}_{\diamond})$$

2.
$$a \diamond b = \inf(\{a,b\}, \leq^{\wedge})$$

Proof. Let $a, b \in X$.

3.1. INTRODUCTION 35

1. Exercise 3.1.1.5 implies that $a \diamond b \in \text{ub}(\{a,b\},\leq^{\vee}_{\diamond})$. Let $c \in \text{ub}(\{a,b\},\leq^{\vee}_{\diamond})$. Since $a \leq^{\vee}_{\diamond} c$ and $b \leq^{\vee}_{\diamond} c$, Exercise 3.1.3.3 implies that $a \diamond c = c$ and $b \diamond c = c$. Therefore

$$(a \diamond b) \diamond c = a \diamond (b \diamond c)$$
$$= a \diamond c$$
$$= c.$$

Another application of Exercise 3.1.3.3 implies that $a \diamond b \leq_{\diamond}^{\vee} c$. Since $c \in \text{ub}(\{a,b\},\leq_{\diamond}^{\vee})$ is arbitrary, we have that for each $c \in \text{ub}(\{a,b\},\leq_{\diamond}^{\vee})$, $a \diamond b \leq_{\diamond}^{\vee} c$. Therefore $a \diamond b = \sup(\{a,b\},\leq_{\diamond}^{\vee})$.

2. FINISH!!!

Definition 3.1.3.5. Let (X, \leq) be a poset. Then (X, \leq) is said to be a

- join-semilattice if for each $a, b \in X$, sup $\{a, b\}$ exists.
- meet-semilattice if for each $a, b \in X$, $\inf\{a, b\}$ exists.

Exercise 3.1.3.6. Let (X,\diamond) be a semilattice. Then

- 1. $(X, \leq^{\vee}_{\diamond})$ is a join-semilattice
- 2. (X, \leq^{\wedge}) is a meet-semilattice

Proof. Exercise 3.1.3.4 implies that

- 1. For each $a, b \in X$, $\sup(\{a, b\}, \leq^{\vee}) = a \diamond b$. Thus (X, \leq^{\vee}) is a join-semilattice.
- 2. for each $a, b \in X$, $\inf(\{a, b\}, \leq_{\diamond}^{\wedge}) = a \diamond b$. Thus $(X, \leq_{\diamond}^{\wedge})$ is a meet-semilattice.

Definition 3.1.3.7. Let (X, \leq) be a poset.

- If (X, \leq) is a join-semilattice, we define the **join operator on** X **induced by** \leq , denoted $\vee_{\leq} : X \times X \to X$, by $a \vee_{<} b := \sup\{a, b\}$.
- If (X, \leq) is a meet-semilattice, we define the **meet operator on** X **induced by** \leq , denoted $\land \leq : X \times X \to X$, by $a \land < b := \inf\{a, b\}$.

Exercise 3.1.3.8. Let (X, \leq) be a poset.

- 1. If (X, \leq) an join-semilattice, then $\vee_{<}$ is a semilattice operator on X.
- 2. If (X, \leq) an meet-semilattice, then \wedge_{\leq} is a semilattice operator on X.

Proof.

- 1. Suppose that (X, \leq) an join-semilattice.
 - (a) Let $a, b, c \in X$. Exercise 2.3.1.8 implies that

$$\begin{split} (a \vee_{\leq} b) \vee_{\leq} c &= \sup \{ \sup \{a,b\},c \} \\ &= \sup \{ \sup \{a,b\}, \sup \{c\} \} \\ &= \sup \{a,b,c\} \\ &= \sup \{ \sup \{a\}, \sup \{b,c\} \} \\ &= \sup \{a,\sup \{b,c\} \} \\ &= a \vee_{\leq} (b \vee_{\leq} c). \end{split}$$

Hence $\vee_{<}$ is associative.

• Let $a \in X$. Then

$$a \lor_{\leq} a = \sup\{a, a\}$$
$$= \sup\{a\}$$
$$= a.$$

Hence \vee_{\leq} is idempotent.

• Let $a, b \in X$. Then

$$a \lor_{\leq} b = \sup\{a, b\}$$
$$= \sup\{b, a\}$$
$$= b \lor_{<} a.$$

Hence \vee_{\leq} is commutative.

Since \vee_{\leq} is associative, idempotent and commutative, \vee_{\leq} is a semilattice operator on X.

2. Similar to (1).

Exercise 3.1.3.9. Let (X, \leq) be a poset.

1. If (X, \leq) is a join-semilattice, then

(a)
$$\leq_{\vee_{<}}^{\vee} = \leq$$
,

(b)
$$\leq_{\vee_{<}}^{\wedge} = \leq^{\mathrm{op}}$$
.

2. If (X, \leq) is a meet-semilattice, then

(a)
$$\leq_{\wedge_{<}}^{\wedge} = \leq$$
,

(b)
$$\leq_{\wedge_{\leq}}^{\vee} = \leq^{op}$$
.

Proof.

1. Suppose that (X, \leq) is a join-semilattice.

(a) Let $a, b \in X$. Then

$$\begin{array}{cccc} a \leq^\vee_{\vee_\leq} b & \Longleftrightarrow & a \vee_\leq b = b & \text{(Exercise 3.1.3.3)} \\ & \Longleftrightarrow & \sup(\{a,b\},\leq) = b & \text{(Definition 3.1.3.7)} \\ & \Longleftrightarrow & a \leq b & \text{(Exercise 2.3.1.9)}. \end{array}$$

Since $a, b \in X$ are arbitrary, we have that $\leq_{\vee_{<}}^{\vee} = \leq$.

(b) Exercise 3.1.1.4 implies that

$$\begin{array}{l} \leq^{\wedge}_{\vee_{\leq}} = (\leq^{\vee}_{\vee_{\leq}})^{\mathrm{op}} \\ = \leq^{\mathrm{op}}. \end{array}$$

2. Similar to (1).

Exercise 3.1.3.10. Let (X, \diamond) be a semilattice. Then

1. \leq^{\vee}_{\diamond} is the unique partial order \leq on X such that (X, \leq) is a join-semilattice and for each $a, b \in X$, $a \diamond b = \sup(\{a, b\}, \leq)$.

 $2. \ \leq_{\diamond}^{\wedge} \text{ is the unique partial order} \leq \text{on } X \text{ such that } (X, \leq) \text{ is an meet-semilattice and for each } a, b \in X, \ a \diamond b = \inf(\{a, b\}, \leq).$

3.1. INTRODUCTION 37

Proof.

1. Let \leq be partial order on X. Suppose that (X, \leq) is a join-semilattice and for each $a, b \in X$, $a \diamond b = \sup(\{a, b\}, \leq)$. Let $a, b \in X$. Then

$$a \le b \iff b = \sup(\{a, b\}, \le)$$
 (Exercise 2.3.1.9)
 $\iff a \diamond b = b$ (by assumption)
 $\iff a \le_{\diamond}^{\lor} b$ (Exercise 3.1.3.3).

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, $a \le b$ iff $a \le_{\diamond}^{\lor} b$. Hence $\le = \le_{\diamond}^{\lor}$.

2. Similar to (1).

Exercise 3.1.3.11. Let (X, \leq) be a poset.

- 1. If (X, \leq) is a join-semilattice, then \vee_{\leq} is the unique semilattice operator \diamond on X such that for each $a, b \in X$, $a \diamond b = \sup(\{a, b\}, \leq)$.
- 2. If (X, \leq) is a meet-semilattice, then $\land \leq$ is the unique semilattice operator \diamond on X such that for each $a, b \in X$, $a \diamond b = \inf(\{a, b\}, \leq)$.

Proof.

1. Let $\diamond: X \times X \to X$ be a semilattice operator on X. Suppose that $a,b \in X, \ a \diamond b = \sup(\{a,b\}, \leq)$. Then for each $a,b \in X$,

$$a \diamond b = \sup(\{a, b\}, \leq)$$
 (by assumption)
= $a \lor < b$ (Definition 3.1.3.7).

Hence $\diamond = \vee_{<}$.

2. Similar to (1).

3.1.4 Lattices

Definition 3.1.4.1. Let X be a set and \vee , \wedge semilattice operators on X. Then \vee and \wedge are said to satisfy the lattice absorption identities if for each $a, b \in X$,

- 1. $a \wedge (a \vee b) = a$
- $2. \ a \lor (a \land b) = a$

Exercise 3.1.4.2. Let X be a set and \vee , \wedge semilattice operators on X. Then \vee and \wedge satisfy the lattice absorption identities iff \vee and \wedge satisfy the skew lattice absorption identities.

Proof.

- (⇒): Clear by commutativity.
- (\Leftarrow) : Immediate.

Definition 3.1.4.3. Let X be a set and \vee , \wedge semilattice operators on X. Then (X, \vee, \wedge) is said to be an **lattice** if \vee and \wedge satisfy the skew lattice absorption identities.

Definition 3.1.4.4. Let (X, \leq) be a poset. Then (X, \leq) is said to be an **ordered lattice** if (X, \leq) is a join-semilattice and (X, \leq) is a meet-semilattice.

Exercise 3.1.4.5. Let (X, \vee, \wedge) be an lattice. Then (X, \leq_{\vee}^{\vee}) is an ordered lattice.

Proof. Exercise 3.1.3.6 implies that (X, \leq^{\vee}_{\vee}) is a join-semilattice and $(X, \leq^{\wedge}_{\wedge})$ is a meet-semilattice. Exercise 3.1.2.2 implies that $\leq^{\vee}_{\vee} = \leq^{\wedge}_{\wedge}$. Therefore (X, \leq^{\vee}_{\vee}) is a join-semilattice and (X, \leq^{\vee}_{\vee}) is a meet-semilattice. Hence (X, \leq^{\vee}_{\vee}) is an ordered lattice.

Exercise 3.1.4.6. Let (X, \leq) be an ordered lattice. Then $(X, \vee_{\leq}, \wedge_{\leq})$ is an lattice.

Proof. Let $a, b \in X$.

- 1. Since $\sup\{a,b\} \in \text{ub}\{a,b\}$ is an upper bound of $\{a,b\}$, we have that $a \leq \sup\{a,b\}$. Since $a \leq a$, we have that $a \in \text{lb}\{a,\sup\{a,b\}\}$. Hence $a \leq \inf\{a,\sup\{a,b\}\}$.
 - Since $\inf\{a, \sup\{a, b\}\}\in \mathbb{Ib}\{a, \sup\{a, b\}\}\$, we have that $\inf\{a, \sup\{a, b\}\}\leq a$.

Since $a \le \inf\{a, \sup\{a, b\}\}\$ and $\inf\{a, \sup\{a, b\}\}\$ $\le a$, we have that

$$a \wedge_{\leq} (a \vee_{\leq} b) = \inf\{a, \sup\{a, b\}\}\$$

= a .

2. Similarly, $a \lor < (a \land < b) = a$.

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$,

- 1. $a \land < (a \lor < b) = a$
- 2. $a \lor < (a \land < b) = a$

Hence \vee_{\leq} and \wedge_{\leq} satisfy the lattice absorption identities. Therefore $(X, \vee_{\leq}, \wedge_{\leq})$ is an lattice.

Exercise 3.1.4.7. Let (X, \leq) be an ordered lattice. Then

- 1. $\leq^{\vee}_{\vee} = \leq^{\wedge}_{\wedge} = \leq$
- $2. \leq^{\wedge}_{\vee} = \leq^{\vee}_{\wedge} = \leq^{\mathrm{op}}$

Proof. Since (X, \leq) is an ordered lattice, (X, \leq) is a join-semilattice (X, \leq) is a meet-semilattice. Exercise 3.1.3.9 then implies that

1.

$$\leq^\vee_{\vee_\leq} = \leq \\ = \leq^\wedge_{\wedge_\leq}$$

2.

$$\begin{array}{c} \leq^{\wedge}_{\vee_{\leq}} = \leq^{\mathrm{op}} \\ = \leq^{\vee}_{\wedge_{\leq}} \end{array}$$

Exercise 3.1.4.8. Let (X, \vee, \wedge) be an lattice. Then \leq^{\vee}_{\vee} is the unique partial order \leq on X such that (X, \leq) is an ordered lattice and for each $a, b \in X$, $a \vee b = \sup(\{a, b\}, \leq)$.

Proof. Let \leq be a partial order on X. Suppose that (X, \leq) is an ordered lattice and for each $a, b \in X$, $a \lor b = \sup(\{a, b\}, \leq)$. Since (X, \lor) is a semilattice, (X, \leq_{\lor}^{\lor}) and (X, \leq) are join-semilattices and for each $a, b \in X$, $a \lor b = \sup(\{a, b\}, \leq_{\lor}^{\lor})$ and $a \lor b = \sup(\{a, b\}, \leq)$, Exercise 3.1.3.10 implies that $\leq = \leq_{\lor}^{\lor}$.

3.1. INTRODUCTION 39

Exercise 3.1.4.9. Let (X, \leq) be an ordered lattice. Then $\vee_{\leq}, \wedge_{\leq}$ are the unique semilattice operators \vee, \wedge on X such that (X, \vee, \wedge) is an lattice and for each $a, b \in X$, $a \vee b = \sup(\{a, b\}, \leq)$

Proof. Let \vee , \wedge be semilattice operators on X. Suppose that (X, \vee, \wedge) is a lattice and for each $a, b \in X$, $a \vee b = \sup(\{a, b\}, \leq)$. Then for each $a, b \in X$,

$$\begin{split} a \vee_{\leq} b &= \sup(\{a,b\}, \leq) \quad \text{(Definition 3.1.3.7)} \\ &= a \vee b \quad \text{(by assumption)}. \end{split}$$

Thus $\vee = \vee_{\leq}$. Since (X, \vee, \wedge) is a lattice and for each $a, b \in X$, $a \vee b = \sup(\{a, b\}, \leq)$, Exercise 3.1.4.8 implies that $\leq_{\vee}^{\vee} = \leq$. Exercise 3.1.2.2 then implies that

$$\leq^{\wedge}_{\wedge} = \leq^{\vee}_{\vee}$$

= \leq .

Therefore for each $a, b \in X$,

$$a \wedge b = \inf(\{a, b\}, \leq^{\wedge}_{\wedge})$$
 (Exercise 3.1.3.4)
= $\inf(\{a, b\}, \leq)$
= $a \wedge_{\leq} b$ (Definition 3.1.3.7).

Hence $\wedge = \wedge_{\leq}$.

3.2 Basic Structures

3.2.1 Bounded Lattices

Definition 3.2.1.1. Let L be a lattice.

- Let $a \in L$. Then
 - a is said to be a **one** of L if for each $x \in L$, $x \wedge a = x$
 - -a is said to be a **zero** of L if for each $x \in L$, $x \vee a = x$.
- Then
 - L is said to have a zero if there exists $0 \in L$ such that 0 is a zero of L
 - L is said to have a one if there exists $1 \in L$ such that 1 is a one of L
 - -L is said to be **bounded** if L has a zero and L has a one.

Exercise 3.2.1.2. Let L be a lattice and $a, b \in L$.

- 1. If a, b are zeros of L, then a = b.
- 2. If a, b are ones of L, then a = b.

Proof.

1. Suppose that a, b are zeros of L. Then

$$a = a \wedge b$$
$$= b \wedge a$$
$$= b.$$

2. Similar to (1).

Note 3.2.1.3.

- If L has a one, we denote the unique one of L by 1.
- If L has a zero, we denote the unique zero of L by 0.

Exercise 3.2.1.4. Let L be a lattice. Then

- 1. there exists $a \in L$ such that a is a one of L iff ub $L = \{a\}$.
- 2. there exists $a \in L$ such that a is a zero of L iff $lb L = \{a\}$.

Proof.

1. \bullet (\Longrightarrow):

Suppose that there exists $a \in L$ such that x is a one of L. Let $x \in L$. Since $x \wedge a = x$, we have that $x \leq a$. Since $x \in L$ is arbitrary, we have that for each $x \in L$, $x \leq a$. Hence $a \in \text{ub } L$. Exercise 2.3.1.10 then implies that $\text{ub } L = \{a\}$.

(⇐=):

Suppose that ub $L = \{a\}$. Let $x \in L$. Then Since $a \in \text{ub } L$, $x \leq a$. Therefore

$$x \wedge a = \inf\{x, a\}$$
$$= x.$$

Since $x \in L$ is arbitrary, we have that for each $x \in L$, $x \wedge a = x$. Hence a is a one of L.

2. Similar to (1).

3.2. BASIC STRUCTURES 41

3.2.2 Complete Lattices

Exercise 3.2.2.1. Let (X, \leq) be a poset. Then for each $A \subset X$, sup A exists iff for each $A \subset X$, inf A exists.

Proof.

- (\Longrightarrow): Suppose that for each $A\subset X$, $\sup A$ exists. Let $A\subset X$. Define
- (⇐=):

Definition 3.2.2.2. Let (X, \leq) be a poset. Then (X, \leq) is said to be a **complete lattice** if for each $A \subset X$, sup A exists.

3.2.3 Irreducibility and Primality

Definition 3.2.3.1. Let (L, \leq) be a poset.

- Suppose that (L, \leq) is a join-semilattice.
 - Let $x \in L$. Then x is said to be
 - * join-irreducible if
 - 1. x is not a zero of L,
 - 2. for each $a, b \in L$, $x = a \lor b$ implies that x = a or x = b
 - * join-prime
 - 1. x is not a zero of L,
 - 2. if for each $a, b \in L$, $x \leq a \vee b$ implies that $x \leq a$ or $x \leq b$
 - We define
 - * $JI(L) := \{x \in L : x \text{ is join-irreducible.}\}$
 - * $JP(L) := \{x \in L : x \text{ is join-prime.}\}$
- Suppose that (L, \leq) is a meet-semilattice.
 - Let $x \in L$. Then x is said to be
 - * meet-irreducible
 - 1. x is not a one of L,
 - 2. if for each $a,b\in L,\, x=a\wedge b$ implies that x=a or x=b
 - * meet-prime if
 - 1. x is not a one of L,
 - 2. for each $a, b \in L$, $a \land b \leq x$ implies that $a \leq x$ or $b \leq x$
 - We define
 - * $MI(L) := \{x \in L : x \text{ is meet-irreducible.}\}$
 - * $MP(L) := \{x \in L : x \text{ is meet-prime.}\}$

Exercise 3.2.3.2. Let (L, \leq) be a poset.

- 1. Suppose that (L, \leq) is a join-semilattice. Then $JP(L) \subset LI(L)$.
- 2. Suppose that (L, \leq) is a meet-semilattice. Then $MP(L) \subset MI(L)$.

Proof.

1. Let $x \in JP(L)$.

- (a) Since x is join-prime, x is not at zero of L.
- (b) Let $a, b \in L$. Suppose that $x = a \lor b$. Then $x \le a \lor b$. Since x is join-prime, $x \le a$ or $x \le b$.
 - Suppose that $x \leq a$. Then

$$a \lor b = x$$

$$\leq a$$

$$\leq a \lor b$$

and therefore x = a. Thus $x \le a$ implies that x = a.

• Similarly, $x \leq b$ implies that x = b.

Since $x \le a$ or $x \le b$, we have that x = a or x = b. Since $a, b \in L$ with $x = a \lor b$ are arbitrary, we have that for each $a, b \in L$, $x = a \lor b$ implies that x = a or x = b.

Thus $x \in JI(L)$. Since $x \in JP(L)$ is arbitrary, we have that for each $x \in JP(L)$, $x \in JI(L)$. Hence $JP(L) \subset JI(L)$.

2. Similar to (1) use duality.

3.2.4 Lattice Homomorphisms

Definition 3.2.4.1. Let $(X, \leq_X), (Y, \leq_Y)$ be posets and $f: X \to Y$.

- 1. Suppose that $(X, \leq_X), (Y, \leq_Y)$ are join-semilattices. Then f is said to be **finite** (\leq_X, \leq_Y) -**join preserving** if for each $a, b \in X$, $f(a \vee_{\leq_X} b) = f(a) \vee_{\leq_Y} f(b)$
- 2. Suppose that $(X, \leq_X), (Y, \leq_Y)$ are meet-semilattices. Then f is said to be **finite** (\leq_X, \leq_Y) -meet **preserving** if for each $a, b \in X$, $f(a \wedge_{\leq_X} b) = f(a) \wedge_{\leq_Y} f(b)$

Exercise 3.2.4.2. Let $(X, \leq_X), (Y, \leq_Y)$ be posets.

- 1. Suppose that (X, \leq_X) and (Y, \leq_Y) are join semilattices. Then f is (\leq_X, \leq_Y) -monotone iff for each $a, b \in X$, $f(a) \vee_{\leq_Y} f(b) \leq_Y f(a \vee_{\leq_X} b)$.
- 2. Suppose that (X, \leq_X) and (Y, \leq_Y) are meet semilattices. Then f is (\leq_X, \leq_Y) -monotone iff for each $a, b \in X$, $f(a) \vee_{\leq_Y} f(b) \leq_Y f(a \vee_{\leq_X} b)$.

Proof.

1. • (\Longrightarrow): Suppose that f is (\leq_X, \leq_Y) -monotone. Let $a, b \in X$. Exercise 2.2.4.7 implies that $f(a \vee_{\leq_X} b) \in \text{ub}(\{f(a), f(b)\}, \leq_Y)$. Therefore

$$f(a) \vee_{\leq_Y} f(b) = \sup(\{f(a), f(b)\}, \leq_Y)$$

$$\leq f(a \vee_{\leq_X} b).$$

Since $a, b \in X$ are arbitrary, we have that for each $a, b \in X$, $f(a) \vee_{\leq_Y} f(b) \leq_Y f(a \vee_{\leq_X} b)$.

• (\Leftarrow): Suppose that for each $a, b \in X$, $f(a) \vee_{\leq_Y} f(b) \leq_Y f(a \vee_{\leq_X} b)$. Let $a, b \in X$. Suppose that $a \leq_X b$. Exercise 2.3.1.9 then implies that $a \vee_{\leq_X} b = b$. By assumption,

$$f(a) \vee_{\leq_Y} f(b) \leq_Y f(a \vee_{\leq_X} b)$$

$$= f(b)$$

$$\leq f(a) \vee_{\leq_Y} f(b).$$

Therefore $f(a) \vee_{\leq_Y} f(b) = f(b)$. Another application of Exercise 2.3.1.9 implies that $f(a) \leq_Y f(b)$. Since $a, b \in X$ with $a \leq b$ are arbitrary, we have that for each $a, b \in X$, $a \leq_X b$ implies that $f(a) \leq_Y f(b)$. Hence f is (\leq_X, \leq_Y) -monotone.

3.2. BASIC STRUCTURES 43

2. use duality FINISH!!!

Exercise 3.2.4.3. Let $(X, \leq_X), (Y, \leq_Y)$ be posets.

1. Suppose that (X, \leq_X) and (Y, \leq_Y) are join semilattices. If f preserves finite joins, then f is (\leq_X, \leq_Y) -monotone.

2. Suppose that (X, \leq_X) and (Y, \leq_Y) are meet semilattices. If f preserves finite meets, then f is (\leq_X, \leq_Y) -monotone. *Proof.*

1. Suppose that f preserves finite joins. Then the previous exercise implies that

for each
$$a, b \in X$$
, $f(a) \vee_{\leq_Y} f(b) = f(a \vee_{\leq_X} b) \implies$ for each $a, b \in X$, $f(a) \vee_{\leq_Y} f(b) \leq f(a \vee_{\leq_X} b)$ $\implies f$ is (\leq_X, \leq_Y) -monotone

2. Suppose that (X, \leq_X) and (Y, \leq_Y) are meet semilattices. If f preserves finite meets, then f is (\leq_X, \leq_Y) -monotone.

Definition 3.2.4.4. Let $(X, \leq_X), (Y, \leq_Y)$ be complete lattices and $f: X \to Y$. Then f is said to

- 1. **preserve arbitrary joins** if for each $A \subset X$, $f(\sup(A, \leq_X)) = \sup(f(A), \leq_Y)$
- 2. **preserve arbitrary meets** if for each $A \subset X$, $f(\inf(A, \leq_X)) = \inf(f(A), \leq_Y)$

3.3 Lattice Ideals and Filters

3.3.1 Introduction

Definition 3.3.1.1. Let L be a lattice.

- Let $J \subset L$. Then
 - J is said to be an **ideal of** L if
 - 1. $J \neq \emptyset$,
 - 2. for each $a, b \in J$, $a \lor b \in J$,
 - 3. for each $x \in L$ and $x \in J$, $x \land a \in J$,
 - J is said to be an **filter of** L if
 - 1. $J \neq \emptyset$,
 - 2. for each $a, b \in J$, $a \land b \in J$,
 - 3. for each $x \in L$ and $a \in J$, $x \vee a \in J$.
- We define
 - $-\mathcal{I}(L) := \{J \subset L : J \text{ is an ideal of } L\}$
 - $\mathcal{F}(L) := \{ J \subset L : J \text{ is a filter of } L \}$

Exercise 3.3.1.2. Let L be a lattice. If $L \neq \emptyset$, then

- 1. $L \in \mathcal{I}(L)$,
- 2. $L \in \mathcal{F}(L)$.

Proof. Clear. (maybe fill out later)

Exercise 3.3.1.3. Let L be a lattice and $J \subset L$. Set $\leq_J := \leq |_{J^2}$. Then

- 1. $J \in \mathcal{I}(L)$ iff J is a \leq -lower set and (J, \leq_J) is upward directed. rework after making some exercises about subprosets, subdirected sets and subposets and showing facts about sup inf of subprosets and upper/lower sets in sub-prosets
- 2. $J \in \mathcal{F}(L)$ iff J is an \leq -upper set and (J, \leq_J) is downward directed.

Proof.

1. \bullet (\Longrightarrow):

Suppose that $J \in \mathcal{I}(L)$.

- Let $x \in L$ and $a \in J$. Suppose that $x \leq a$. Then $x = \inf(\{a, b\}, \leq)$ and therefore

$$x = \inf(\{x, a\}, \leq)$$
$$= x \land_{\leq} a$$
$$\in J.$$

Since $a \in J$ and $x \in L$ with $x \leq a$ are arbitrary, we have that J is a down set.

- Since $J \in \mathcal{I}(L)$, we have that $J \neq \emptyset$. Let $a, b \in J$. Since $J \in \mathcal{I}(L)$,

$$\sup(\{a, b\}, \leq)$$

$$= a \vee_{\leq} b$$

$$\in J.$$

Hence (ref ex here)

$$\sup(\{a, b\}, \le) = \sup(\{a, b\}, \le_J)$$

\(\in \text{ub}(\{a, b\}, <_J)

and ub($\{a,b\}, \leq_J$) $\neq \varnothing$. Since $a,b \in J$ are arbitrary, we have that for each $a,b \in J$, ub($\{a,b\}, \leq_J$) $\neq \varnothing$. Since $J \neq \varnothing$ and for each $a,b \in J$, ub(J, \leq_J) $\neq \varnothing$, we have that J, \leq_J is upward directed.

• (<==):

Suppose that J is a \leq -lower set and (J, \leq_J) is upward directed.

- (a) Since (J, \leq_J) is upward directed, $J \neq \emptyset$.
- (b) Let $a, b \in J$. Since (J, \leq_J) is upward directed, ub $(\{a, b\}, \leq_J) \neq \emptyset$. Thus there exists (ref ex here)

$$c \in \text{ub}(\{a, b\}, \leq_J) \tag{3.1}$$

$$\subset \operatorname{ub}(\{a,b\},\leq). \tag{3.2}$$

Therefore $\sup(\{a,b\},\leq) \leq c$. Since J is a \leq -lower set, $c \in J$ and $\sup(\{a,b\},\leq) \leq c$, we have that

$$a \lor b = \sup(\{a, b\}, \leq)$$

 $\in J$

Since $a, b \in J$ are arbitrary, we have that for each $a, b \in J$, $a \lor b \in J$. rework after making some exercises about subprosets, subdirected sets and subposets and showing facts about sup inf of subprosets and upper/lower sets in sub-prosets

(c) Let $x \in L$ and $a \in J$. Then $x \wedge a \leq a$. Since J is a \leq -lower set, $x \wedge a \in J$. Since $x \in L$ and $a \in J$ are arbitrary, we have that for each $x \in L$ and $a \in J$, $x \wedge a \in J$.

Therefore $J \in \mathcal{I}(L)$.

2.

Exercise 3.3.1.4. Let L be a lattice and $J \subset L$.

- 1. If L has a zero and $J \in \mathcal{I}(L)$, then $0 \in J$.
- 2. If L has a one and $J \in \mathcal{F}(L)$, then $1 \in J$.

Proof.

- 1. Suppose that L has a zero and $J \in \mathcal{I}(L)$. Since J is an ideal of L, $J \neq \emptyset$ and a previous ex implies J is a lower set. Hence there exists $a \in J$. a prev ex implies that $0 \in \text{lb } L$. Thus $0 \le a$. Since J is a lower set, $0 \in J$.
- 2. Similar to (1).

Exercise 3.3.1.5. Let L be a lattice.

- 1. Let $(J_{\alpha})_{\alpha \in A} \subset \mathcal{I}(L)$.
 - (a) If $\bigcap_{\alpha \in A} J_{\alpha} \neq \emptyset$, then $\bigcap_{\alpha \in A} J_{\alpha} \in \mathcal{I}(L)$.
 - (b) If $A = \{1, 2\}$, then $\bigcap_{\alpha \in A} J_{\alpha} \in \mathcal{I}(L)$.
 - (c) If L has a zero, then $\bigcap_{\alpha \in A} J_{\alpha} \in \mathcal{I}(L)$.
- 2. Let $(J_{\alpha})_{\alpha \in A} \subset \mathcal{F}(L)$.
 - (a) If $\bigcap_{\alpha \in A} J_{\alpha} \neq \emptyset$, then $\bigcap_{\alpha \in A} J_{\alpha} \in \mathcal{F}(L)$.
 - (b) If $A = \{1, 2\}$, then $\bigcap_{\alpha \in A} J_{\alpha} \in \mathcal{F}(L)$.
 - (c) If L has a one, then $\bigcap_{\alpha \in A} J_{\alpha} \in \mathcal{F}(L)$.

Proof. Set $J := \bigcap_{\alpha \in A} J_{\alpha}$.

- 1. (a) Suppose that $J \neq \emptyset$.
 - i. By assumption $J \neq \emptyset$.
 - ii. Let $a, b \in J$ and $\alpha \in A$. Then $a, b \in J_{\alpha}$. Since $J_{\alpha} \in \mathcal{I}(L)$, $a \lor b \in J_{\alpha}$. Since $\alpha \in A$ is arbitrary, we have that for each $\alpha \in A$, $a \lor b \in J_{\alpha}$. Hence $a \lor b \in J$.
 - iii. Let $x \in L$, $a \in J$ and $\alpha \in A$. Then $a \in J_{\alpha}$. Since $J_{\alpha} \in \mathcal{I}(L)$, $x \in L$ and $a \in J_{\alpha}$, we have that $x \wedge a \in J_{\alpha}$. Since $\alpha \in A$ is arbitrary, we have that for each $\alpha \in A$, $x \wedge a \in J_{\alpha}$. Hence $x \wedge a \in J$. Since $x \in L$ and $a \in J$ are arbitrary, we have that for each $x \in L$ and $a \in J$, $x \wedge a \in J$.

Thus $J \in \mathcal{I}(L)$.

- (b) Suppose that $A = \{1, 2\}.$
 - i. Since $J_1, J_2 \in \mathcal{I}(L)$, $J_1 \neq \emptyset$ and $J_2 \neq \emptyset$. Thus there exist $x_1 \in J_1$ and $x_2 \in J_2$. Since $J_1 \in \mathcal{I}(L)$, $x_2 \in L$ and $x_1 \in J_1$, we have that $x_1 \wedge x_2 \in J_1$. Similarly, $x_1 \wedge x_2 \in J_2$. Hence $x_1 \wedge x_2 \in J_1 \cap J_2$ and $J_1 \cap J_2 \neq \emptyset$. Part 1(a) implies that $J_1 \cap J_2 \in \mathcal{I}(L)$.

- (c) Suppose that L has a zero. Let $\alpha \in A$. Since $J_{\alpha} \in \mathcal{I}(L)$, a previous exercise implies that $0 \in J_{\alpha}$. Since $\alpha \in A$ is arbitrary, we have that for each $\alpha \in A$, $0 \in J_{\alpha}$. Hence $0 \in J$. Thus $J \neq \emptyset$. The
- 2. Similar to (1).

Exercise 3.3.1.6. Let L be a lattice. Then

- 1. for each $J_1, J_2 \in \mathcal{I}(L)$, $\{x \in L : \text{there exist } a \in J_1 \text{ and } b \in J_2 \text{ such that } x \leq a \vee b\} \in \mathcal{I}(L)$.
- 2. for each $J_1, J_2 \in \mathcal{F}(L)$, $\{x \in L : \text{there exist } a \in J_1 \text{ and } b \in J_2 \text{ such that } a \vee b \leq x\} \in \mathcal{F}(L)$ (maybe FIX!!!).

Proof.

- 1. Let $J_1, J_2 \in \mathcal{I}(L)$. Set $J := \{x \in L : \text{there exist } a \in J_1 \text{ and } b \in J_2 \text{ such that } x \leq a \vee b\}$.
 - (a) Since $J_1, J_2 \in \mathcal{I}(L)$, we have that $J_1 \neq \emptyset$ and $J_2 \neq \emptyset$. Hence there exist $x_1 \in J_1$ and $x_2 \in J_2$. Since $x_1 \leq x_1 \vee x_2$, we have that $x_1 \in J$. Thus $J \neq \emptyset$.
 - (b) Let $a, b \in J$. Then there exist $x_a, x_b \in J_1$ and $y_a, y_b \in J_2$ such that $a \le x_a \lor y_a$ and $b \le x_b \lor y_b$. Define $z_1, z_2 \in L$ by $z_1 := x_a \lor x_b$ and $z_2 := y_a \lor y_b$. Since $J_1, J_2 \in \mathcal{I}(L)$, we have that $z_1 \in J_1$ and $z_2 \in J_2$. We note that

$$a \leq x_a \vee y_a$$

$$\leq (x_a \vee y_a) \vee (x_b \vee y_b)$$

$$= (x_a \vee x_b) \vee (y_a \vee y_b)$$

$$= z_1 \vee z_2.$$

and similarly $b \leq z_1 \vee z_2$. Therefore $z_1 \vee z_2 \in \text{ub}(\{a,b\},\leq)$. Hence

$$a \lor b = \sup(\{a, b\}, \leq)$$

$$< z_1 \lor z_2.$$

Thus $a \lor b \in J$. Since $a, b \in J$ are arbitrary, we have that for each $a, b \in J$, $a \lor b \in J$.

(c) Let $x \in L$ and $y \in J$. Then there exists $a \in J_1$ and $b \in J_2$ such that $y \leq a \vee b$. Then

$$x \wedge y \le y < a \vee b.$$

Therefore $x \wedge y \in J$. Since $x \in L$ and $y \in J$ are arbitrary, we have that for each $x \in L$ and $y \in J$, $x \wedge y \in J$. Therefore $J \in \mathcal{I}(L)$.

2. Similar to (1). FINISH!!!

Definition 3.3.1.7. Let L be a lattice. Define $\leq_{\mathcal{I}(L)} := \subset |_{\mathcal{I}(L)}$ (maybe standardize notation).

Exercise 3.3.1.8. Let L be a lattice.

- 1. Let $J_1, J_2 \in \mathcal{I}(L)$.
 - (a) $\sup(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}) = \{x \in L : \text{there exist } a \in J_1 \text{ and } b \in J_2 \text{ such that } x \leq a \vee b\}.$
 - (b) $\inf(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}) = J_1 \cap J_2$
- 2. Set $\leq_{\mathcal{F}(L)} := \subset |_{\mathcal{F}(L)}$ (maybe standardize notation). Let $J_1, J_2 \in \mathcal{F}(L)$. FIX!!!
 - (a) $\sup(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}) = \{x \in L : \text{there exist } a \in J_1 \text{ and } b \in J_2 \text{ such that } x \leq a \vee b\}.$
 - (b) $\inf(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}) = J_1 \cap J_2$

Proof.

- 1. (a) Set $J := \{x \in L : \text{there exist } a \in J_1 \text{ and } b \in J_2 \text{ such that } x \leq a \vee b\}$. (ref previous ex) implies that $J \in \mathcal{I}(L)$.
 - i. Let $a \in J_1$. Since $J_2 \in \mathcal{I}(L)$, $J_2 \neq \emptyset$. Hence there exists $b \in J_2$. Then $a \leq a \vee b$. Since $a \in J_1$, $b \in J_2$ and $a \leq a \vee b$, we have that $a \in J$. Since $a \in J_1$ is arbitrary, we have that for each $a \in J_1$, $a \in J$. Thus $J_1 \subset J$.
 - Similarly, $J_2 \subset J$.

Since $J_1, J_2 \subset J$, we have that $J \in \text{ub}(\{J_1, J_2\}, \leq_{\mathcal{I}(L)})$.

ii. Let $K \in \text{ub}(\{J_1, J_2\}, \leq_{\mathcal{I}(L)})$ and $x \in J$. Then $J_1, J_2 \subset K$ and there exist $a \in J_1$ and $b \in J_2$ such that $x \leq a \vee b$. Since $a \in J_1$, $b \in J_2$ and $J_1, J_2 \subset K$, we have that $a, b \in K$. Since $K \in \mathcal{I}(L)$, $a \vee b \in K$. Since $K \in \mathcal{I}(L)$ (ref a prev ex) implies that K is a lower set. Since K is a lower set, $a \vee b \in K$ and $x \leq a \vee b$, we have that $x \in K$. Since $x \in J$ is arbitrary, we have that for each $x \in J$, $x \in K$. Hence $J \subset K$. Since $K \in \text{ub}(\{J_1, J_2\}, \leq_{\mathcal{I}(L)})$ is arbitrary, we have that for each $K \in \text{ub}(\{J_1, J_2\}, \leq_{\mathcal{I}(L)})$, $J \leq_{\mathcal{I}(L)} K$.

Since

- i. $J \in ub(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}),$
- ii. for each $K \in \text{ub}(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}), J \leq_{\mathcal{I}(L)} K$,

we have that $J = \sup(\{J_1, J_2\}, \leq_{\mathcal{I}(L)})$.

(b) (ref previous ex) implies that $J_1 \cap J_2 \in \mathcal{I}(L)$. Since $J_1 \cap J_2 \subset J_1$ and $J_1 \cap J_2 \subset J_2$, we have that $J_1 \cap J_2 \in lb(\{J_1, J_2\}, \leq_{\mathcal{I}(L)})$. Since $(\mathcal{I}(L), \leq_{\mathcal{I}(L)})$ is a subposet of $(\mathcal{P}(L), \subset)$, (define subproset/subposet and make exercise for the following fact) implies that

$$\inf(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}) \leq \inf(\{J_1, J_2\}, \subset)$$

$$= J_1 \cap J_2$$

$$< \inf(\{J_1, J_2\}, <_{\mathcal{I}(L)}).$$

Hence $J_1 \cap J_2 = \inf(\{J_1, J_2\}, \leq_{\mathcal{I}(L)}).$

2. Similar to (1). FINISH!!!

3.3.2 Properties of Ideals and Filters

Definition 3.3.2.1. Let L be a lattice.

- Let $J \in \mathcal{I}(L)$. Then J is said to be
 - **proper** if $J \neq L$.
 - **maximal** if J is maximal in $(\mathcal{I}(L) \setminus \{L\}, \subset)$.
 - **prime** if
 - 1. J is proper
 - 2. for each $a, b \in L$, $a \land b \in J$ implies that $a \in J$ or $b \in J$.
 - **principal** if there exists $a \in L$ such that $J = \downarrow a$.
- Let $J \in \mathcal{F}(L)$. Then J is said to be
 - **proper** if $J \neq L$.
 - **maximal** if J is maximal in $(\mathcal{F}(L) \setminus \{L\}, \subset)$.
 - **prime** if
 - 1. J is proper
 - 2. for each $a,b\in L,\, a\vee b\in J$ implies that $a\in J$ or $b\in J.$
 - **principal** if there exists $a \in L$ such that $J = \uparrow a$.

Exercise 3.3.2.2. Let L be a lattice and $J \subset L$.

- 1. Suppose $J \in \mathcal{I}(L)$.
 - (a) If J is proper, then for each $x \in J$, x is not a one of L.
 - (b) If J is prinicpal, then J is proper iff for each $x \in J$, x is not a one of L.
- 2. Suppose $J \in \mathcal{F}(L)$.
 - (a) If J is proper, then for each $x \in J$, x is not a zero of L.
 - (b) If J is prinicpal, then J is proper iff for each $x \in J$, x is not a zero of L.

Proof.

1. (a) Suppose that J is proper. Let $x \in J$. For the sake of contradiction, suppose that x is a one of L. (previous ex) then implies that $(L, \leq) = \{x\}$. Let $y \in L$. Then $y \leq x$. Since J is a lower set, $x \in J$ and $y \leq x$, we have that $y \in J$. Since $y \in L$ is arbitrary, we have that for each $y \in L$, $y \in J$. Thus

$$L \subset J$$
$$\subset L.$$

Thus J = L and J is not proper. Therefore x is not a one of L. Since $x \in J$ is arbitrary, we have that for each $x \in J$, x is not a one of L.

- (b) Suppose that J is principal.
 - (⇒):

If J is proper, then 1(a) implies that for each $x \in J$, x is not a one of L.

• (<=):

Suppose that J is not proper. Then J=L. Since J is principal, there exists $a\in J$ such that $J=\downarrow a$. Let $x\in L$. Since

$$x \in L$$

$$= J$$

$$= \downarrow a,$$

we have that $x \leq a$. Hence

$$x \wedge a = \inf\{x, a\}$$
$$= x.$$

Since $x \in L$ is arbitrary, we have that for each $x \in L$, $x \wedge a = x$. Hence a is a one of L. Therefore J is not proper implies that there exists $a \in J$ such that a is a one of L. By contrapositive, we have that if for each $x \in J$, x is not a one of L, then J is proper.

2. FINISH!!

Exercise 3.3.2.3. Let L be a lattice and $J \subset L$.

- 1. Suppose that $J \in \mathcal{I}(L)$ and J is principal. Then J is prime iff there exists $x \in J$ such that x is meet-prime and $J = \downarrow x$.
- 2. Suppose that $J \in \mathcal{F}(L)$ and J is principal. Then J is prime iff there exists $x \in J$ such that x is join-prime and $J = \uparrow x$. *Proof.*
 - 1. \bullet (\Longrightarrow):

Suppose that J is prime. Since J is principal, there exists $x \in L$ such that $J = \downarrow x$. Since J is prime, J is proper and for each $a, b \in L$, $a \land b \in J$ implies that $a \in J$ or $b \in J$.

- Since J is proper, previous exercise implies that x is not a one of L.
- Let $a, b \in L$. Suppose that $a \wedge b \leq x$. Since J is a lower set, $x \in J$ and $a \wedge b \leq x$, we have that $a \wedge b \in J$. Therefore $a \in J$ or $b \in J$. Since $J = \downarrow x$, we have that $a \leq x$ or $b \leq x$. Since $a, b \in L$ with $a \wedge b \leq x$ are arbitrary, we have that for each $a, b \in L$, $a \wedge b \leq x$ implies that $a \leq x$ or $b \leq x$.

Thus x is meet-prime.

(⇐=):

Suppose that there exists $x \in J$ such that x is meet-prime and $J = \downarrow x$. Then J is principal.

- For the sake of contradiction, suppose that J is not proper. Then

$$\downarrow x = J \\
= L.$$

Thus ub $L = \{x\}$. A previous ex implies that x is a one of L. This is a contraction since x is meet-prime. Thus J is proper.

- Let $a, b \in L$. Suppose that $a \wedge b \in J$. Since $J = \downarrow x$, we have that $a \wedge b \leq x$. Since x is meet-prime, $a \leq x$ or $b \leq x$. Hence $a \in J$ or $b \in J$. Since $a, b \in L$ with $a \wedge b \in J$ are arbitrary, we have that for each $a, b \in L$, $a \wedge b \in J$ implies that $a \in J$ or $b \in J$.

Therefore J is prime.

2. Similar to (1) FIX/CHECK/FINISH!!!

- least upper bound (LUB) property if for each $A \subset X$, if $A \neq \emptyset$ and A is bounded above, then there exists $x \in X$ such that $x = \sup A$
- greatest lower bound (GLB) property if for each $A \subset X$, if $A \neq \emptyset$ and A is bounded below, then there exists $x \in X$ such that $x = \inf A$.

Exercise 3.4.1.2. LUB iff GLB

Proof. FINISH!!!!

Definition 3.4.1.3. Suplattice:

Let (L, \leq) be a poset. Then (L, \leq) is said to be a **suplattice** if for each $A \subset L$, there exists $x \in L$ such that $x = \sup A$.

3.4.2 Complete Lattice Homomorphisms

3.4.3 Galois Connections

3.5 Modular and Distributive Lattices

3.5.1 Introduction

Definition 3.5.1.1. Let L be a lattice. Then L is said to be a **distributive lattice** if for each $a, b, c \in L$, $a \lor (b \land c) = (a \lor b) \land (a \lor c)$.

Exercise 3.5.1.2. Let L be a lattice. Then for each $a, b, c \in L$,

- 1. $(a \wedge b) \vee (a \wedge c) \leq a \wedge (b \vee c)$.
- 2. $a \land (b \lor c) \le (a \lor b) \land (a \lor c)$

Proof. Let $a, b, c \in L$.

1. • Since $a \wedge b \leq a$ and $a \wedge c \leq a$, we have that $a \in \text{ub}\{a \wedge b, a \wedge c\}$. Therefore

$$(a \wedge b) \vee (a \wedge c) = \sup\{a \wedge b, a \wedge c\}$$

 $\leq a.$

• Since

$$\begin{aligned} a \wedge b &\leq b \\ &\leq b \vee c \end{aligned}$$

and

$$a \land c \le c$$

$$\le b \lor c,$$

we have that $b \lor c \in \text{ub}\{a \land b, a \land c\}$. Therefore

$$(a \wedge b) \vee (a \wedge c) = \sup\{a \wedge b, a \wedge c\}$$

 $\leq b \vee c.$

Then $(a \wedge b) \vee (a \wedge c) \in lb\{a, b \vee c\}$. Hence

$$(a \wedge b) \vee (a \wedge c) \le \inf\{a, b \vee c\}$$
$$= a \wedge (b \vee c).$$

2. FINISH!!! (use duality)

Exercise 3.5.1.3. Let L be a lattice. Then for each $a, b, c \in L$,

- 1. $c \leq a$ implies that $(a \wedge b) \vee c \leq a \wedge (b \vee c)$
- 2. $a \leq c$ implies that $a \vee (b \wedge c) \leq (a \vee b) \wedge c$

Proof. Let $a, b, c \in L$.

1. Suppose that $c \leq a$. Then $a \wedge c = c$. The previous exercise then implies that

$$(a \wedge b) \vee c = (a \wedge b) \vee (a \wedge c)$$

 $\leq a \wedge (b \vee c).$

2. FINISH!!! use duality

Exercise 3.5.1.4. Let L be a lattice. Then for each $a, b, c \in L$,

$$(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) \leq (a \vee b) \wedge (b \vee c) \wedge (c \vee a).$$

Proof. Let $a, b, c \in L$.

• We first note that

$$a \wedge b \le a \le a \vee b,$$

$$b \wedge c \le b \le a \vee b,$$

$$c \wedge a \le a \le a \vee b.$$

Therefore $a \vee b \in \text{ub}\{a \wedge b, b \wedge c, c \wedge a\}$ and

$$(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) = \sup\{a \wedge b, b \wedge c, c \wedge a\}$$

$$\leq a \vee b.$$

• Similarly,

$$a \wedge b \leq b \leq b \vee c,$$

$$b \wedge c \leq c \leq b \vee c,$$

$$c \wedge a \leq c \leq b \vee c.$$

Therefore $b \lor c \in \text{ub}\{a \land b, b \land c, c \land a\}$ and

$$(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) = \sup\{a \wedge b, b \wedge c, c \wedge a\}$$

$$< b \vee c.$$

• Finally, we have that

$$a \wedge b \leq a \leq c \vee a$$
,
 $b \wedge c \leq c \leq c \vee a$,
 $c \wedge a \leq c \leq c \vee a$.

Therefore $c \vee a \in \text{ub}\{a \wedge b, b \wedge c, c \wedge a\}$ and

$$(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) = \sup\{a \wedge b, b \wedge c, c \wedge a\}$$

$$< c \vee a.$$

Hence $(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) \in lb\{a \vee b, b \vee c, c \vee a\}$ and

$$(a \wedge b) \vee (b \wedge c) \vee (c \wedge a) \le \inf\{a \vee b, b \vee c, c \vee a\}$$
$$= (a \vee b) \wedge (b \vee c) \wedge (c \vee a).$$

Exercise 3.5.1.5. Let L be a lattice. Then the following are equivalent:

- 1. For each $a, b, c \in L$, $c \le a$ implies that $a \land (b \lor c) = (a \land b) \lor c$.
- 2. For each $a, b, c \in L$, $c \leq a$ implies that $a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c)$.
- 3. For each $p, q, r \in L$, $p \wedge (q \vee (p \wedge r)) = (p \wedge q) \vee (p \wedge r)$.

Proof.

1. $(1) \implies (2)$:

Suppose that for each $a, b, c \in L$, $c \le a$ implies that $a \land (b \lor c) = (a \land b) \lor c$. Let $a, b, c \in L$. Suppose that $c \le a$. Then $a \land c = c$. By assumption

$$a \wedge (b \vee c) = (a \wedge b) \vee c$$
$$= (a \wedge b) \vee (a \wedge c)$$

Since $a, b, c \in L$ with $c \le a$ are arbitrary, we have that for each $a, b, c \in L$, $c \le a$ implies that $a \land (b \lor c) = (a \land b) \lor (a \land c)$.

 $2. (2) \implies (3)$:

Suppose that for each $a, b, c \in L$, $c \le a$ implies that $a \land (b \lor c) = (a \land b) \lor (a \land c)$. Let $p, q, r \in L$. Define $a, b, c \in L$ by a := p, b := q and $c := p \land r$. Then

$$a \wedge c = p \wedge (p \wedge r)$$
$$= (p \wedge p) \wedge r$$
$$= p \wedge r.$$

By assumption,

$$p \wedge (q \vee (p \wedge r)) = a \wedge (b \vee c)$$
$$= (a \wedge b) \vee (a \wedge c)$$
$$= (p \wedge q) \vee (p \wedge r).$$

Since $p,q,r\in L$ are arbitrary, we have that for each $p,q,r\in L$, $p\wedge (q\vee (p\wedge r))=(p\wedge q)\vee (p\wedge r)$.

 $3. (3) \Longrightarrow (1)$:

Suppose that for each $p,q,r\in L$, $p\wedge (q\vee (p\wedge r))=(p\wedge q)\vee (p\wedge r)$. Let $a,b,c\in L$. Suppose that $c\leq a$. Define $p,q,r\in L$ by $p:=a,\ q:=b$ and r:=c. Since $c\leq a$, we have that

$$p \wedge r = a \wedge c$$
$$= c.$$

By assumption,

$$\begin{split} a \wedge (b \vee c) &= p \wedge (q \vee (p \wedge r)) \\ &= (p \wedge q) \vee (p \wedge r) \\ &= (a \wedge b) \vee c. \end{split}$$

Since $a, b, c \in L$ with $c \leq a$ are arbitrary, we have that for each $a, b, c \in L$, $c \leq a$ implies that $a \land (b \lor c) = (a \land b) \lor c$.

Definition 3.5.1.6. Let L be a lattice. Then L is said to be **modular** if for each $a, b, c \in L$,

$$c \leq a$$
 implies that $a \wedge (b \vee c) = (a \wedge b) \vee c$.

Exercise 3.5.1.7. Let L be a lattice. Then the following are equivalent:

- 1. For each $a, b, c \in L$, $a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c)$.
- 2. For each $p, q, r \in L$, $p \vee (q \wedge r) = (p \vee q) \wedge (p \vee r)$.

Proof.

 $1. (1) \implies (2)$:

Suppose that for each $a, b, c \in L$, $a \land (b \lor c) = (a \land b) \lor (a \land c)$. Let $p, q, r \in L$. Define $a, b, c \in L$ by $a := p \lor q$, b := p and c := r. By absorption,

$$a \wedge b = (p \vee q) \wedge p$$
$$= p \wedge (p \vee q)$$
$$= p.$$

By assumption,

$$a \wedge c = (p \vee q) \wedge r$$
$$= r \wedge (p \vee q)$$
$$= (r \wedge p) \vee (r \wedge q).$$

Then by assumption and absorption,

$$\begin{split} (p \lor q) \land (p \lor r) &= a \land (b \lor c) \\ &= (a \land b) \lor (a \land c) \\ &= p \lor [(r \land p) \lor (r \land q)] \\ &= [p \lor (r \land p)] \lor (r \land q) \\ &= [p \lor (p \land r)] \lor (q \land r) \\ &= p \lor (q \land r). \end{split}$$

Since $p, q, r \in L$ are arbitrary, we have that for each $p, q, r \in L$, $p \vee (q \wedge r) = (p \vee q) \wedge (p \vee r)$.

 $2. (2) \implies (1)$:

Suppose that for each $p,q,r \in L$, $p \lor (q \land r) = (p \lor q) \land (p \lor r)$. Let $a,b,c \in L$. Define $p,q,r \in L$ by $p := a \land b, q := a$ and r := c. By absorption,

$$p \lor q = (a \land b) \lor a$$
$$= a \lor (a \land b)$$
$$= a.$$

By assumption,

$$p \lor r = (a \land b) \lor c$$
$$= c \lor (a \land b)$$
$$= (c \lor a) \land (c \lor b).$$

Then by assumption and absorption,

$$(a \wedge b) \vee (a \wedge c) = p \vee (q \wedge r)$$

$$= (p \vee q) \wedge (p \vee r)$$

$$= a \wedge [(c \vee a) \wedge (c \vee b)]$$

$$= [a \wedge (c \vee a)] \wedge (c \vee b)$$

$$= [a \wedge (a \vee c)] \wedge (b \vee c)$$

$$= a \wedge (b \vee c).$$

Since $a, b, c \in L$ are arbitrary, we have that for each $a, b, c \in L$, $a \land (b \lor c) = (a \land b) \lor (a \land c)$.

Definition 3.5.1.8. Let L be a lattice. Then L is said to be **distributive** if for each $a, b, c \in L$,

$$a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c).$$

Exercise 3.5.1.9. Let L be a lattice. If L is distributive, then L is modular.

Proof. Suppose that L is distributive. FINISH!!!

Exercise 3.5.1.10. Let L be a lattice. Then for each $a,b,c\in L$, $a\vee(b\wedge c)=(a\vee b)\wedge(a\vee c)$ iff $a\wedge(b\vee c)=(a\wedge b)\vee(a\vee c)$. *Proof.* Let $a,b,c\in L$.

- (\Longrightarrow): Suppose that $a \lor (b \land c) = (a \lor b) \land (a \lor c)$.
- (⇐=):

3.6 Galois Connections

Definition 3.6.0.1. Let

Chapter 4

Frames and Locales

4.1 Introduction

4.1.1 Frames

Definition 4.1.1.1. Let L be a complete lattice. Then L is said to be a **frame** if for each $a \in L$ and $(b_{\alpha})_{\alpha \in A} \subset L$, $a \wedge \left(\bigvee_{\alpha \in A} b_{\alpha}\right) = \bigvee_{\alpha \in A} a \wedge b_{\alpha}$.

Definition 4.1.1.2. Let L, M be frames and $f: L \to M$. Then f is said to be a **frame homomorphism** if

- 1. for each $(x_{\alpha})_{\alpha \in A} \subset L$, $f\left(\bigvee_{\alpha \in A} x_{\alpha}\right) = \sup_{\alpha \in A} f(x_{\alpha})$.
- 2. for each $a, b \in L$, $f(a \wedge b) = f(a) \wedge f(b)$

maybe reword this with some vocab to make shorter, like "preserves arbitrary joins" and "preserves meets"

Definition 4.1.1.3. (check notation consistent with category theory notes) We define the category of frames, denoted Frm, by

- $Obj(Frm) := \{L : L \text{ is a frame}\}\$
- $\operatorname{Hom}_{\mathbf{Frm}}(L, M) := \{ f : L \to M : f \text{ is a frame homomorphism} \}$

Exercise 4.1.1.4. We have that Frm is a category

Proof. FINISH!!!

4.1.2 Locales

Definition 4.1.2.1. We define the **category of locales**, denoted **Loc** by $\mathbf{Loc} := \mathbf{Frm}^{\mathrm{op}}$.

4.2 More Lattice Stuff to Come

- talk about join and meet irriducibility
- talk about join and meet primality
- ullet talk about maximality.
- the goal is to get all the background for sober topological/measure spaces, locale theory for constructive topology and universal algebra

Chapter 6

Some Chapter

6.1 Closure Operators

Definition 6.1.0.1. Let A be a set and $C: \mathcal{P}(A) \to \mathcal{P}(A)$. Then C is said to be a **closure operator on** A if for each $X, Y \in \mathcal{P}(A)$,

- 1. $X \subset C(X)$,
- 2. $C^2(X) = C(X)$,
- 3. $X \subset Y$ implies that $C(X) \subset C(Y)$.

Exercise 6.1.0.2. Let A be a set and $C: \mathcal{P}(A) \to \mathcal{P}(A)$. Suppose that C is a closure operator on A. Then for each $(E_j)_{j \in J} \subset \mathcal{P}(A)$,

1.
$$C\left(\bigcap_{j\in J} E_j\right) \subset \bigcap_{k\in J} C(E_k),$$

2.
$$\bigcup_{k \in J} C(E_k) \subset C\left(\bigcup_{j \in J} E_j\right)$$
.

Proof. Let $(E_j)_{j\in J}\subset \mathcal{P}(A)$.

1. Let $k \in J$. Then $\bigcap_{j \in J} E_j \subset E_k$. So $C\left(\bigcap_{j \in J} E_j\right) \subset C(E_k)$. Since $k \in J$ is arbitrary, we have that

$$C\left(\bigcap_{j\in J} E_j\right) \subset \bigcap_{k\in J} C(E_k).$$

2. Let $k \in J$. Then $E_k \subset \bigcup_{j \in J} E_j$. Hence $C(E_k) \subset C\left(\bigcup_{j \in J} E_j\right)$. Since $k \in J$ is arbitrary, we have that

$$\bigcup_{k \in J} C(E_k) \subset C\bigg(\bigcup_{j \in J} E_j\bigg)$$

Definition 6.1.0.3. Let A be a set, $C: \mathcal{P}(A) \to \mathcal{P}(A)$ and $X \subset A$. Suppose that C is a closure operator on A. Then X is said to be C-closed if C(X) = X.

Definition 6.1.0.4. Let A be a set and $C: \mathcal{P}(A) \to \mathcal{P}(A)$. Suppose that C is a closure operator on A. We define the lattice of C-closed subsets of A, denoted $L_C(A) \subset \mathcal{P}(A)$, by

$$L_C(A) := \{X \subset A : X \text{ is } C\text{-closed}\}$$

Exercise 6.1.0.5. Let A be a set and $C: \mathcal{P}(A) \to \mathcal{P}(A)$. Suppose that C is a closure operator on A. Then

- 1. for each $(E_j)_{j\in J}\subset L_C(A),\ \bigcap_{j\in J}E_j\in L_C(A)$ and $\bigcup_{j\in J}E_j\in L_C(A).$
- 2. $(L_C(A), \subset)$ is a complete lattice define complete lattice

$$C\bigg(\bigcap_{j\in J} E_j\bigg) = \bigcap_{j\in J} E_j$$

and

$$C\left(\bigcup_{j\in J} E_j\right) = \bigcup_{j\in J} E_j.$$

Proof.

- 1. Let $(E_j)_{j\in J}\subset L_C(A)$.
 - A previous exercise Exercise B.0.0.3 implies that

$$C\left(\bigcap_{j\in J} E_j\right) \subset \bigcap_{k\in J} C(E_k)$$

$$= \bigcap_{k\in J} E_k$$

$$\subset C\left(\bigcap_{k\in J} E_k\right).$$

Hence
$$C\left(\bigcap_{j\in J} E_j\right) = \bigcap_{k\in J} E_k$$
.

• A previous exercise Exercise B.0.0.3 implies that

$$\bigcup_{k \in J} E_k = \bigcup_{k \in J} C(E_k)$$

$$\subset C \bigg(\bigcup_{j \in J} E_j \bigg)$$

$$\subset \bigcap_{k \in J} C(E_k)$$

$$= \bigcap_{k \in J} E_k$$

$$\subset C \bigg(\bigcap_{k \in J} E_k \bigg).$$

Hence
$$C\left(\bigcap_{j\in J} E_j\right) = \bigcap_{k\in J} E_k$$
.

2.

FINISH!!!, don't need to show second part,

Definition 6.1.0.6. then is said to be an algebraic closure operator on A if

Chapter 7

Universal Algebra

7.1 Introduction

Definition 7.1.0.1. Let $A, J \in \text{Obj}(\mathbf{Set})$ be a set and $f \in \mathcal{F}^*(A)^J$. Then (A, f) is said to be an **algebra** if $A \neq \emptyset$ and $J \neq \emptyset$.

Definition 7.1.0.2. Let (A, f) be an algebra. Set J := dom f.

- We define the **universe of** (A, f), denoted Uni(A, f), by Uni(A, f) := A.
- We define the **operations of** (A, f), denoted Oper(A, f), by Oper(A, f) := f.
- We define the **type of** (A, f), denoted Type $(A, f) : J \to \mathbb{N}_0$, by Type $(A, f)(j) := \text{arity } f_j$.

Definition 7.1.0.3. Let \mathcal{A} , \mathcal{B} be algebras. Then \mathcal{A} and \mathcal{B} are said to be **type-similar**, denoted $\mathcal{A} \sim_{\text{Type}} \mathcal{B}$, if Type $\mathcal{A} = \text{Type } \mathcal{B}$.

Definition 7.1.0.4. Let (A, f), (B, g) be algebras and $\alpha : A \to B$. Suppose that $(A, f) \sim_{\text{Type}} (B, g)$. Set J := dom f and $\rho := \text{Type}(A, f)$. Write $f = (f_j)_{j \in J}$ and $g = (g_j)_{j \in J}$. Then α is said to be an ((A, f), (B, g))-homomorphism if for each $j \in J$ and $a \in A^{\rho(j)}$,

$$g_i(\alpha^{\rho(j)}(a)) = \alpha(f_i(a)).$$

Exercise 7.1.0.5. Let (A, f), (B, g), (C, h) be algebras and $\alpha : A \to B, \beta : B \to C$. Suppose that $(A, f) \sim_{\text{Type}} (B, g), (C, h)$. Set J := dom f and $\rho := \text{Type}(A, f)$. Write $f = (f_j)_{j \in J}, g = (g_j)_{j \in J}$ and $h = (h_j)_{j \in J}$. If α is a ((A, f), (B, g))-homomorphism and β is a ((B, g), (C, h))-homomorphism, then $\beta \circ \alpha$ is a ((A, f), (C, h))-homomorphism.

Proof. Suppose that α is a ((A, f), (B, g))-homomorphism and β is a ((B, g), (C, h))-homomorphism. Let $j \in J$ and $a \in A^{\rho(j)}$. Since α is a ((A, f), (B, g))-homomorphism, $g_j(\alpha^{\rho(j)}(a)) = \alpha(f_j(a))$. Define $b \in B^{\rho(j)}$ (special case $\rho(j) = 0$?) by $b := \alpha^{\rho(j)}(a)$. Since β is a ((B, g), (C, h))-homomorphism, $h_j(\beta^{\rho(j)}(b)) = \beta(g_j(b))$. Therefore

$$h_{j}([\beta \circ \alpha]^{\rho(j)}(a)) = h_{j}(\beta^{\rho(j)} \circ \alpha^{\rho(j)}(a))$$

$$= h_{j}(\beta^{\rho(j)}(\alpha^{\rho(j)}(a)))$$

$$= h_{j}(\beta^{\rho(j)}(b))$$

$$= \beta(g_{j}(b))$$

$$= \beta(g_{j}(\alpha^{\rho(j)}(a)))$$

$$= \beta(\alpha(f_{j}(a)))$$

$$= \beta \circ \alpha(f_{j}(a)).$$

Since $j \in J$ and $a \in A^{\rho(j)}$ are arbitrary, we have that for each $j \in J$ and $a \in A^{\rho(j)}$, $h_j([\beta \circ \alpha]^{\rho(j)}(a)) = \beta \circ \alpha(f_j(a))$. Hence $\beta \circ \alpha$ is a ((A, f), (C, h))-homomorphism.

Definition 7.1.0.6. Define category of algebras $\mathbf{Alg}(\rho)$ of a given type ρ . FINISH!!!!

7.2 Subalgebras

Definition 7.2.0.1. Let $(A, f), (B, g) \in \text{Obj}(\mathbf{Alg})$. Suppose that (A, f) and (B, g) are type-similar. Set J := dom f and $\rho := \text{Type}(A, f)$. Write $f = (f_j)_{j \in J}$ and $g = (g_j)_{j \in J}$.

- Then (B,g) is said to be a **subalgebra of** (A,f) if
 - 1. $B \subset A$
 - 2. for each $j \in J$, $f_j|_{B^{\rho(j)}} = g_j$.
- We define SubAlg(\mathcal{A}) := { $\mathcal{B} \in \text{Obj}(\mathbf{Alg}) : \mathcal{A} \sim_{\text{Type}} \mathcal{B}$ and \mathcal{B} is a subalgebra of \mathcal{A} }.

Definition 7.2.0.2. Let $(A, f) \in \text{Obj}(\mathbf{Alg})$ and $B \in \text{Obj}(\mathbf{Set})$.

- Then B is said to be a **subuniverse of** (A, f) if
 - 1. $B \subset A$,
 - 2. B is Im f-closed.
- We define SubUni(\mathcal{A}) := { $B \in \text{Obj}(\mathbf{Set}) : B \text{ is a subuniverse of } \mathcal{A}$ }.

Exercise 7.2.0.3. Let (A, f), (B, g) be algebras. Suppose that (A, f) and (B, g) are type-similar. If (B, g) is a subalgebra of (A, f), then B is a subuniverse of A.

Proof. Set J := dom f and $\rho := \text{Type}(A, f)$. Suppose that (B, g) is a subalgebra of (A, f).

- 1. Since (B, g) is a subalgebra of (A, f), we have that $B \subset A$.
- 2. Let $j \in J$. Then for each $a \in B^{\rho}(j)$,

$$f_j(a_1, \dots, a_{\rho(j)}) = f_j|_{B^{\rho(j)}}(a_1, \dots, a_{\rho(j)})$$

= $g_j(a_1, \dots, a_{\rho(j)})$
 $\in B.$

Since $j \in J$ is arbitrary, we have that B is Im f-closed. Thus B is a subuniverse of A.

Definition 7.2.0.4. Let \mathcal{A} be an algebra and B a subuniverse of \mathcal{A} . Set $\mathcal{S}(B,\mathcal{A}) := \{S \subset A : S \text{ is a subuniverse of } \mathcal{A} \text{ and } B \subset S\}$. We define the **subuniverse of** \mathcal{A} **generated by** B, denoted $\operatorname{Sg}(B,\mathcal{A})$, by

$$\operatorname{Sg}(B,\mathcal{A}) := \bigcap_{S \in \mathcal{S}(B,\mathcal{A})} S$$

show $S \neq \emptyset$ and intersection of subiniverses is subuniverse

Exercise 7.2.0.5. Let (A, f) be an algebra and $B \subset A$. Then

- 1. Sg(B, f) is a subuniverse of A
- 2. $B \subset \operatorname{Sg}(B, f)$.

Proof.

1. Set $S := \{S \subset A : S \text{ is an } f\text{-subuniverse of } A\}$. By construction, for each $S \in S$, S is f-closed. Since $\operatorname{Sg}(B, f) = \bigcap_{S \in S} S$, Exercise B.0.0.3 A previous exercise in the set theory section implies that $\operatorname{Sg}(B, f)$ is f-closed. Hence $\operatorname{Sg}(B, f)$ is an f-subuniverse of A.

7.2. SUBALGEBRAS 65

2. By construction, for each $S \in S, B \subset S$. Thus

$$B \subset \bigcap_{S \in \mathcal{S}} S$$
$$= \operatorname{Sg}(B, f).$$

Exercise 7.2.0.6. Let (A, f) be an algebra. Then $\mathrm{Sg}(\cdot, f)$ is an algebraic closure operator on A.

Proof.

Chapter 8

Groups

8.0.1 Direct Products

Definition 8.0.1.1. Let G, H be groups. Define a product $*: (G \times H) \times (G \times H) \to G \times H$ by

$$(x_1, y_1) * (x_2, y_2) = (x_1x_2, y_1y_2)$$

Then $(G \times H, *)$ is called the **direct product of** G **and** H.

Exercise 8.0.1.2. Let G, H be groups. Then the direct product $G \times H$ is a group.

Proof. Clear.

Definition 8.0.1.3. Let G, H be groups. Define $\pi_G : G \times H \to G$ and $\pi_H : G \times H \to H$ by $\pi_G(x, y) = x$ and $\pi_H(x, y) = y$. Then π_G and π_H are respectively called the **projection maps onto** G and H.

Exercise 8.0.1.4. Let G, H be groups. Then

- 1. $\pi_G: G \times H \to G$ and $\pi_H: G \times H \to H$ are homomorphisms
- 2. $\ker \pi_G \cong H$ and $\ker \pi_H \cong G$

Proof.

- 1. Clear
- 2. Define $\iota_G: G \to \ker \pi_H$ by

$$\iota_G(x) = (x, e_H)$$

Then ι_G is an isomorphism. Similarly, we can define $\iota_H: H \to \ker \pi_G$ and show that it is an isomorphism.

Definition 8.0.1.5. Let G, H, K be groups, $\phi \in \text{Hom}(G, K)$ and $\psi \in \text{Hom}(H, K)$. We define $\phi \times \psi : G \times H \to K$ by $\phi \times \psi(x, y) = \phi(x)\psi(y)$

Exercise 8.0.1.6. Let G, H, K be groups, $\phi \in \text{Hom}(G, K)$ and $\psi \in \text{Hom}(H, K)$. If K is abelian, then $\phi \times \psi \in Hom(G \times H, K)$.

Proof. Let $x_1, x_2 \in G$ and $y_1, y_2 \in H$. Then

$$\begin{split} \phi \times \psi [(x_1, y_1)(x_2, y_2)] &= \phi \times \psi (x_1 x_2, y_1 y_2) \\ &= \phi (x_1 x_2) \psi (y_1 y_2) \\ &= \phi (x_1) \phi (x_2) \psi (y_1) \psi (y_2) \\ &= \phi (x_1) \psi (y_1) \phi (x_2) \psi (y_2) \\ &= [\phi \times \psi (x_1, y_1)] [\phi \times \psi (x_2, y_2)] \end{split}$$

П

Exercise 8.0.1.7. Let G, H, K be groups and $\phi \in \text{Hom}(G \times H, K)$. Then there exist $\phi_G \in \text{Hom}(G, K)$, $\phi_H \in \text{Hom}(H, K)$ such that $\phi_G \times \phi_H = \phi$.

Proof. Suppose that K is abelian. Define $\iota_G \in \operatorname{Hom}(G, \ker \pi_H)$ and $\iota_H \in \operatorname{Hom}(H, \ker \pi_G)$ as in part (2) of Exercise 8.0.1.4 Define $\phi_G \in \operatorname{Hom}(G, K)$ and $\phi_H \in \operatorname{Hom}(H, K)$ by $\phi_G = \phi \circ \iota_G$ and $\phi_H = \phi \circ \iota_H$. Let $(x, y) \in G \times H$. Then

$$\phi_G \times \phi_H(x, y) = \phi_G(x)\phi_H(y)$$

$$= \phi \circ \iota_G(x)\phi \circ \iota_H(y)$$

$$= \phi(x, e_H)\phi(e_G, y)$$

$$= \phi(x, y)$$

So $\phi = \phi_G \times \phi_H$

8.1. RINGS 69

8.1 Rings

Definition 8.1.0.1. Let R be a set and $+, *: R \times R \to R$ (we write a + b and ab in place of +(a, b) and *(a, b) respectively). Then R is said to be a **ring** if for each $a, b, c \in R$,

- 1. R is an abelian group with respect to +. The identity element with respect to + is denoted by 0.
- 2. R is a monoid with respect to *. The identity element of R with respect to * is denoted 1.
- 3. R is commutative with respect to *.
- 4. * distributes over +.

Definition 8.1.0.2. Let R be a ring and $I \subset R$. Then I is said to be an **ideal** of R if for each $a \in R$ and $x, y \in I$,

- 1. $x + y \in I$
- $2. \ ax \in I$

Definition 8.1.0.3. Let R be a ring and $A, B \subset R$. We define the **product** of A and B, denoted AB, to be

$$AB = \left\{ \sum_{i=1}^{n} a_i b_i : a_i \in A, b_i \in B, n \in \mathbb{N} \right\}$$

Exercise 8.1.0.4. Let R be a ring and $I \subset R$. Then I is an ideal of R iff $RI \subset I$.

Proof. Suppose that $RI \subset I$. Let $a \in R$ and $x, y \in I$. Then by assumption $x + y = 1x + 1y \in I$ and $ax \in I$. So I is an ideal of R

Conversely, suppose that I is an ideal of R. Let $a_1, \dots, a_n \in R$ and $x_1, \dots, x_n \in I$. Then by assumption, for each $i = 1, \dots, n$, $a_i x_i \in I$ and therefore $\sum_{i=1}^n a_i b_i \in I$. Hence $RI \subset I$.

8.2 Modules

8.2.1 Introduction

Definition 8.2.1.1. Let R be a ring, M a set, $+: M \times M \to M$ and $*: R \times M \to M$ (we write rx in place of *(r,x)). Then M is said to be an R-module if

- 1. M is an abelian group with respect to +. The identity element of M with respect to + is denoted by 0.
- 2. for each $r \in \mathbb{R}, *(r, \cdot)$ is a group endomorphism of M
- 3. for each $x \in M$, $*(\cdot, x)$ is a group homomorphism from R to M
- 4. * is a monoid action of R on M

Note 8.2.1.2. For the remainder of this section, we assume that R is a commutative ring.

Exercise 8.2.1.3. Let M be an R-module. Then for each $r \in R$ and $x \in M$,

- 1. r0 = 0
- 2. 0x = 0
- 3. (-1)x = -x

Proof. Let $r \in R$ and $x \in M$. Then

1.

$$r0 = r(0+0)$$
$$= r0 + r0$$

which implies that r0 = 0.

2.

$$0x = (0+0)x$$
$$= 0x + 0x$$

which implies that 0x = 0.

3.

$$(-1)x + x = (-1)x + 1x$$
$$= (-1+1)x$$
$$= 0x$$
$$= 0$$

which implies that (-1)x = -x.

Definition 8.2.1.4. Let M an R-module and $N \subset M$. Then N is said to be a **submodule** of M if for each $r \in R$ and $x, y \in N$, we have that $rx \in N$ and $x + y \in N$.

Definition 8.2.1.5. Let M be an R-module. We define $S(M) = \{N \subset M : N \text{ is a submodule of } M\}$.

Exercise 8.2.1.6. Let M be an R-module and $N \in \mathcal{S}(M)$. Then N is a subgroup of M.

Proof. Let $x, y \in M$. Then $x - y = 1x + (-1)y \in N$. So N is a subgroup of M.

Definition 8.2.1.7. Let M be an R-module and $N \in \mathcal{S}(M)$. We define

8.2. MODULES 71

- 1. $M/N = \{x + N : x \in M\}$
- 2. $+: M/N \times M/N \to M/N$ by

$$(x + N) + (y + N) = (x + y) + N$$

3. $*: R \times M/N \to M/N$ by

$$r(x+N) = (rx) + N$$

Under these operations (see next exercise), M/N is an R-module known as the **quotient module** of M by N.

Exercise 8.2.1.8. Let M be an R-module and $N \in \mathcal{S}(M)$. Then

- 1. the monoid action defined above is well defined
- 2. the quotient M/N is an R-module

Proof.

1. Let $r \in R$ and $x + N, y + N \in M/N$. Recall from group theory that x + N = y + N iff $x - y \in N$. Suppose that x + N = y + N. Then $x - y \in N$ and there exists $n \in N$ such that x - y = n. Therefore

$$rx - ry = r(x - y)$$
$$= rn$$
$$\in N$$

So rx + N = ry + N.

2. Properties (1) - (4) in the definition of a module are easily shown to be satisfied for M/N since they are true for M.

Definition 8.2.1.9. Let M and N be R-modules and $\phi: M \to N$. Then ϕ is said to be a **module homomorphism** if for each $r \in R$ and $x, y \in M$

- 1. $\phi(rx) = r\phi(x)$
- 2. $\phi(x+y) = \phi(x) + \phi(y)$

Exercise 8.2.1.10. Let M and N be R-modules and $\phi: M \to N$. Then ϕ is a iff for each $r \in R$ and $x, y \in M$, $\phi(x+ry) = \phi(x) + r\phi(y)$.

Proof. Clear. \Box

Exercise 8.2.1.11. Let M and N be R-modules and $\phi: M \to N$ a homomorphism. Then

- 1. $\ker \phi$ is a submodule of M
- 2. Im ϕ is a submodule of N

Proof. Let $r \in R$, $x, y \in \ker \phi$ and $w, z \in \operatorname{Im} \phi$. Then

1.

$$\phi(rx) = r\phi(x)$$

$$= r0$$

$$= 0$$

So $rx \in \ker \phi$. Group theory tells us that $\ker \phi$ is a subgroup of M, so $x + y \in \ker \phi$. Hence $\ker \phi$ is a submodule of M.

2. Similar.

Definition 8.2.1.12. Let M be an R-module and $A \subset M$. We define the **submodule of** M **generated by** A, denoted $\operatorname{span}(A)$, to be

$$\mathrm{span}(A) = \bigcap_{N \in \mathcal{S}(M)} N$$

Exercise 8.2.1.13. Let M be an R-module and $A \subset M$. Then span $(A) \in \mathcal{S}(M)$

Proof. Let $r \in R$ and $x, y \in \text{span}(A)$. Basic group theory tells us that span(A) is a subgroup of M. So $x + y \in \text{span}(A)$. For $N \in \mathcal{S}(M)$, by definition we have $x \in N$ and therefore $rx \in N$. So $rx \in \text{span}(A)$. Hence span(A) is a submodule of M. \square

Exercise 8.2.1.14. Let M be an R-module and $A \subset M$. If $A \neq \emptyset$, then

$$\operatorname{span}(A) = \left\{ \sum_{i=1}^{n} r_i a_i : r_i \in R, a_i \in A, n \in \mathbb{N} \right\}$$

Proof. Clearly \Box

Definition 8.2.1.15. Let M

8.5 Appendix

8.5.1 Monoids

Definition 8.5.1.1. Let G be a set and $*: G \times G \to G$ (we write ab in place of *(a,b)). Then

- 1. * is called a **binary operation** on G
- 2. * is said to be **associative** if for each $x, y, z \in G$, (xy)z = x(yz)
- 3. * is said to be **commutative** if for each $x, y \in G$, xy = yx

Definition 8.5.1.2. Let G be a set, $*: G \times G \to G$, $e, x, y \in G$. Then e is said to be an **identity element** if for each $x \in G$, ex = xe = x.

Definition 8.5.1.3. Let G be a set and $*: G \times G \to G$. Then G is said to be a **monoid** if

- 1. * is associative
- 2. there exits $e \in G$ such that e is an identity element.

Exercise 8.5.1.4. Let G be a monoid. Then the identity element is unique.

Proof. Let $e, f \in G$. Suppose that e and f are identity elements. Then e = ef = f.

Note 8.5.1.5. Unless otherwise specified, we will denote the identity element of a monoid by e.

Definition 8.5.1.6. Let G be a monoid, X a set and $*: G \times X \to X$ (we write gx in place of *(g,x)). Then * is said to be a **monoid action** of G on X if for each $g, h \in G$ and $x \in X$,

- 1. (gh)x = g(hx)
- 2. ex = x

Appendix A

Summation

Definition A.0.0.1. Let $f: X \to [0, \infty)$, Then we define

$$\sum_{x \in X} f(x) := \sup_{\substack{F \subset X \\ F \text{ finite}}} \sum_{x \in F} f(x)$$

This definition coincides with the usual notion of summation when X is countable. For $f: X \to \mathbb{C}$, we can write f = g + ih where $g, h: X \to \mathbb{R}$. If

$$\sum_{x \in X} |f(x)| < \infty,$$

then the same is true for $g^+,g^-,h^+,h^-.$ In this case, we may define

$$\sum_{x \in X} f(x)$$

in the obvious way.

The following note justifies the notation $\sum_{x \in X} f(x)$ where $f: X \to \mathbb{C}$.

Note A.0.0.2. Let $f: X \to \mathbb{C}$ and $\alpha: X \to X$ a bijection. If $\sum_{x \in X} |f(x)| < \infty$, then $\sum_{x \in X} f(\alpha(x)) = \sum_{x \in X} f(x)$.

Appendix B

Asymptotic Notation

Definition B.0.0.1. Let X be a topological space, Y, Z be normed vector spaces, $f: X \to Y$, $g: X \to Z$ and $x_0 \in X \cup \{\infty\}$. Then we write

$$f = o(g)$$
 as $x \to x_0$

if for each $\epsilon > 0$, there exists $U \in \mathcal{N}(x_0)$ such that for each $x \in U$,

$$||f(x)|| \le \epsilon ||g(x)||$$

Exercise B.0.0.2. Let X be a topological space, Y, Z be normed vector spaces, $f: X \to Y$, $g: X \to Z$ and $x_0 \in X \cup \{\infty\}$. If there exists $U \in \mathcal{N}(x_0)$ such that for each $x \in U \setminus \{x_0\}$, g(x) > 0, then

$$f = o(g) \text{ as } x \to x_0 \quad \text{iff} \quad \lim_{x \to x_0} \frac{\|f(x)\|}{\|g(x)\|} = 0$$

Exercise B.0.0.3. Let X and Y a be normed vector spaces, $A \subset X$ open and $f: A \to Y$. Suppose that $0 \in A$. If $f(h) = o(\|h\|)$ as $h \to 0$, then for each $h \in X$, f(th) = o(|t|) as $t \to 0$.

Proof. Suppose that $f(h) = o(\|h\|)$ as $h \to 0$. Let $h \in X$ and $\epsilon > 0$. Choose $\delta' > 0$ such that for each $h' \in B(0, \delta')$, $h' \in A$ and

$$||f(h')|| \le \frac{\epsilon}{||h|| + 1} ||h'||$$

Choose $\delta > 0$ such that for each $t \in B(0, \delta)$, $th \in B(0, \delta')$. Let $t \in B(0, \delta)$. Then

$$||f(th)|| \le \frac{\epsilon}{||h|| + 1} |t| ||h||$$
$$< \epsilon |t|$$

So f(th) = o(|t|) as $t \to 0$.

Definition B.0.0.4. Let X be a topological space, Y, Z be normed vector spaces, $f: X \to Y$, $g: X \to Z$ and $x_0 \in X \cup \{\infty\}$. Then we write

$$f = O(q)$$
 as $x \to x_0$

if there exists $U \in \mathcal{N}(x_0)$ and $M \geq 0$ such that for each $x \in U$,

$$||f(x)|| \le M||g(x)||$$

Appendix C

Categories

move to notation?

Definition C.0.0.1. We define the category of topological measure spaces, denoted \mathbf{TopMsr}_+ , by

- $\bullet \ \operatorname{Obj}(\mathbf{TopMsr}_+) := \{(X,\mu) : X \in \operatorname{Obj}(\mathbf{Top}) \text{ and } \mu \in M(X)\}$
- $\bullet \ \operatorname{Hom}_{\mathbf{TopMsr}_+}((X,\mu),(Y,\nu)) := \operatorname{Hom}_{\mathbf{Top}}(X,Y) \cap \operatorname{Hom}_{\mathbf{Msr}_+}((X,\mathcal{B}(X),\mu),(Y,\mathcal{B}(Y),\nu))$

Appendix D

Vector Spaces

it might be better to cover some category theory and write everything in terms of $\operatorname{Hom}_{\mathbf{Vect}_{\mathbb{K}}}$ and $\operatorname{Obj}(\mathbf{Vect}_{\mathbb{K}})$

D.1 Introduction

Definition D.1.0.1. Let X be a set, \mathbb{K} a field, $+: X \times X \to X$ and $\cdot: \mathbb{K} \times X \to X$. Then $(X, +, \cdot)$ is said to be a \mathbb{K} -vector space if

1. (X, +) is an abelian group

2.

Definition D.1.0.2. Let $(X, +_X, \cdot_X)$ and $(E, +_E, \cdot_E)$ be vector spaces. Suppose that $E \subset X$. Then $(E, +_E, \cdot_E)$ is said to be a subspace of X if

- 1. $+_E = +_X|_{E \times E}$
- 2. $\cdot_E = \cdot_X|_{\mathbb{K} \times E}$

Exercise D.1.0.3. Let $(X, +_X, \cdot_X)$ and $(E, +_E, \cdot_E)$ be vector spaces. Suppose that $E \subset X$.

Exercise D.1.0.4. Let $(X, +, \cdot)$ be a vector space and $E \subset X$. Then E is a subspace of X

Definition D.1.0.5. Let X be a vector space and $(E_j)_{j\in J}$ a collection of subspaces of X. Then $\bigcap_{j\in J} E_j$ is a subspace of X.

Proof. Set $E := \bigcap_{j \in J} E_j$. Let $x, y \in E$ and $\lambda \in \mathbb{K}$. Then for each $j \in J$, $x, y \in E_j$. Since for each $j \in J$, E_j is a subspace of X, we have that for each $j \in J$, $x + \lambda y \in E_j$. Thus $x + \lambda y \in E$. Since $x, y \in E$ and $\lambda \in \mathbb{K}$ are arbitrary, (cite exercise here) we have that E is a subspace of X.

Definition D.1.0.6. Let X, Y be vector spaces and $T: X \to Y$. Then T is said to be **linear** if for each $x_1, x_2 \in X$ and $\lambda \in \Lambda$,

- 1. $T(x_1 + x_2) = T(x_1) + T(x_2)$,
- 2. $T(\lambda x_1) = \lambda T(x_1)$.

We define $L(X;Y) := \{T : X \to Y : T \text{ is linear}\}.$

Exercise D.1.0.7. Let X, Y be vector spaces and $T: X \to Y$. Then T is linear iff for each $x_1, x_2 \in X$ and $\lambda \in \Lambda$,

$$T(x_1 + \lambda x_2) = T(x_1) + \lambda T(x_2)$$

Proof. Clear. (add details)

Definition D.1.0.8. define addition/scalar multiplication of linear maps

Exercise D.1.0.9. Let X, Y be vector spaces. Then L(X; Y) is a \mathbb{K} -vector space.

Proof. Clear \Box

Definition D.1.0.10. Let X be a vector space over \mathbb{K} and $T: X \to \mathbb{K}$. Then T is said to be a **linear functional on** X if T is linear. We define the **dual space of** X, denoted X^* , by $X^* := \{T: X \to \mathbb{K} : T \text{ is linear}\}$.

Exercise D.1.0.11. Let X be a vector space. Then X^* is a vector space.

Proof. Clear. \Box

D.2 Bases

Definition D.2.0.1. Let X be a vector space and $(e_{\alpha})_{\alpha \in A} \subset X$. Then $(e_{\alpha})_{\alpha \in A}$ is said to be

- linearly independent if for each $(\alpha_j)_{j=1}^n \subset A$, $(\lambda_j)_{j=1}^n \subset \mathbb{K}$, $\sum_{j=1}^n \lambda_j e_{\alpha_j} = 0$ implies that for each $j \in [n]$, $\lambda_j = 0$.
- a Hamel basis for X if $(e_{\alpha})_{\alpha \in A}$ is linearly independent and $\operatorname{span}(e_{\alpha})_{\alpha \in A} = X$.

Exercise D.2.0.2. every vector space has a Hamel basis

 \square

Exercise D.2.0.3.

Exercise D.2.0.4. Let X be a K-vector space and $x \in X$. Then x = 0 iff for each $\phi \in X^*$, $\phi(x) = 0$.

Proof.

- (\Longrightarrow): Suppose that x=0. Linearity implies that for each $\phi \in X^*$ $\phi(x)=0$.
- (\Leftarrow): Conversely, suppose that $x \neq 0$. Define $\epsilon_x : \operatorname{span}(x) \to \mathbb{K}$ by $\epsilon_x(\lambda x) := \lambda$. Let $u, v \in \operatorname{span}(x)$. Then there exists $\lambda_u, \lambda_v \in \mathbb{K}$ such that $u = \lambda_u x$ and $v = \lambda_v x$. Suppose that u = v. Then

$$(\lambda_u - \lambda_v)x = \lambda_u x - \lambda_v x$$
$$= u - v$$
$$= 0$$

Since $x \neq 0$, we have that $\lambda_u - \lambda_v = 0$ and therefore $\lambda_u = \lambda_v$. Hence

$$\lambda_u = \epsilon_x(u)$$
$$= \epsilon_x(v)$$
$$= \lambda_v.$$

Thus ϵ_x is well defined.

D.3. MULTILINEAR MAPS 83

D.3 Multilinear Maps

Definition D.3.0.1. Let X_1, \dots, X_n, Y be vector spaces and $T : \prod_{j=1}^n X_j \to \mathbb{K}$. Then T is said to be **multilinear** if for each $j_0 \in [n]$ and $(x_j)_{j=1}^n \in \prod_{j=1}^n X_j, T(x_1, \dots, x_{j_0-1}, \cdot, x_{j_0+1})$ is linear.

$$L^{n}(X_{1},\ldots,X_{n};Y) = \left\{ T : \prod_{j=1}^{n} X_{j} \to Y : T \text{ is multilinear} \right\}$$

If $X_1 = \cdots = X_n = X$, we write $L^n(X; Y)$ in place of $L^n(X, \ldots, X; Y)$.

Definition D.3.0.2. define addition and scalar mult of multilinear maps

Exercise D.3.0.3. Let X_1, \dots, X_n, Y be vector spaces. Then $L^n(X_1, \dots, X_n; Y)$ is a \mathbb{K} -vector space.

Proof. content...

Exercise D.3.0.4. Let X_1, \dots, X_n, Y, Z be \mathbb{K} -vector spaces, $\alpha \in L^n(X_1, \dots, X_n; Y)$ and $\phi \in L^1(Y; Z)$. Then $\phi \circ \alpha \in L^n(X_1, \dots, X_n; Z)$.

Proof. Let $(x_j)_{j=1}^n \in \prod_{i=1}^n X_j$ and $j_0 \in [n]$. Define $f: X_{j_0} \to Y$ by

$$f(a) := \alpha(x_1, \dots, x_{i_0-1}, a, x_{i_0+1}, \dots, x_n)$$

Since $\alpha \in L^n(X_1, \dots, X_n; Y)$, f is linear. Since ϕ is linear, and $\phi \circ f$ is linear. Since $(x_j)_{j=1}^n \in \prod_{j=1}^n X_j$ and $j_0 \in [n]$ are arbitrary, we have that $\phi \circ \alpha \in L^n(X_1, \dots, X_n; Y)$.

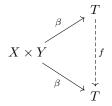

D.4 Tensor Products

Definition D.4.0.1. Let X,Y and T be vector spaces over \mathbb{K} and $\alpha \in L^2(X,Y;T)$. Then (T,α) is said to be a **tensor product of** X **and** Y if for each vector space Z and $\beta \in L^2(X,Y;Z)$, there exists a unique $\phi \in L^1(T;Z)$ such that $\phi \circ \alpha = \beta$, i.e. the following diagram commutes:

$$\begin{array}{ccc} X\times Y \stackrel{\alpha}{\longrightarrow} T \\ & \downarrow^{\phi} \\ Z \end{array}$$

Exercise D.4.0.2. Let X,Y,S,T be vector spaces, $\alpha \in L^2(X,Y;S)$ and $\beta \in L^2(X,Y;T)$. Suppose that (S,α) and (T,β) are tensor products of X and Y. Then S and T are isomorphic.

Proof. Since (T, β) is a tensor product of X and Y, $\beta \in L^2(X, Y; T)$ there exists a unique $f \in L^1(T; T)$ such that $f \ circ\beta = \beta$, i.e. the following diagram commutes:

Since $\operatorname{id}_T \in L^1(T;T)$ and $\operatorname{id}_T \circ \beta = \beta$, we have that $f = \operatorname{id}_T$. Since (S,α) is a tensor product of X and Y, there exists a unique $\phi: S \to T$ such that $\phi \circ \alpha = \beta$, i.e. the following diagram commutes:

$$\begin{array}{c} X \times Y \xrightarrow{\alpha} S \\ \downarrow \phi \\ \uparrow \end{array}$$

Similarly, since (T, β) is a tensor product of X and Y, there exists a unique $\psi : T \to S$ such that $\psi \circ \beta = \alpha$, i.e. the following diagram commutes:

$$\begin{array}{ccc} X \times Y & \xrightarrow{\beta} & T \\ & \downarrow \psi \\ & \downarrow & \\ S & \end{array}$$

Therefore

$$(\phi \circ \psi) \circ \beta = \phi \circ (\psi \circ \beta)$$
$$= \phi \circ \alpha$$
$$= \beta.$$

i.e. the following diagram commutes:

$$X \times Y \xrightarrow{\alpha} S \Longrightarrow X \times Y \downarrow \phi \circ \psi$$

$$X \times Y \xrightarrow{\alpha} S \longrightarrow X \times Y \downarrow \phi \circ \psi$$

$$T \longrightarrow T$$

By uniqueness of $f \in L^1(T;T)$, we have that

$$id_T = f$$
$$= \phi \circ \psi$$

A similar argument implies that $\psi \circ \phi = \mathrm{id}_S$. Hence ϕ and ψ are isomorphisms with $\phi^{-1} = \psi$. Hence S and T are isomorphic.

D.4. TENSOR PRODUCTS

85

Definition D.4.0.3. Let X, Y be vector spaces, $x \in X$ and $y \in Y$. We define $x \otimes y : X^* \times Y^* \to \mathbb{K}$ by $x \otimes y(\phi, \psi) := \phi(x)\psi(y)$. **Exercise D.4.0.4.** Let X, Y be vector spaces, $x \in X$ and $y \in Y$. Then $x \otimes y \in L^2(X^*, Y^*; \mathbb{K})$.

Proof. Let $\phi_1, \phi_2 \in X^*, \psi \in Y^*$ and $\lambda \in \mathbb{K}$. Then

$$x \otimes y(\phi_1 + \lambda \phi_2, \psi) = [\phi_1 + \lambda \phi_2(x)]\psi(y)$$
$$= \phi_1(x)\psi(y) + \lambda \phi_2(x)\psi(y)$$
$$= x \otimes y(\phi_1, \psi) + \lambda x \otimes y(\phi_2, \psi)$$

Since $\phi_1, \phi_2 \in X^*, \psi \in Y^*$ and $\lambda \in \mathbb{K}$ are arbitrary, we have that for each $\psi \in Y^*, x \otimes y(\cdot, \psi)$ is linear. Similarly for each $\phi \in X^*, x \otimes y(\phi, \cdot)$ is linear. Hence $x \otimes y$ is bilinear and $x \otimes y \in L^2(X^*, Y^*; \mathbb{K})$.

Definition D.4.0.5. Let X, Y be vector spaces. We define

• the **tensor product of** X **and** Y, denoted $X \otimes Y \subset L^2(X^*, Y^*; \mathbb{K})$, by

$$X \otimes Y := \operatorname{span}(x \otimes y : x \in X \text{ and } y \in Y),$$

• the **tensor map**, denoted $\otimes : X \times Y \to X \otimes Y$, by $\otimes (x,y) := x \otimes y$.

Exercise D.4.0.6. Let X, Y be vector spaces, $(x_j)_{j=1}^n \subset X$ and $(y_j)_{j=1}^n \subset Y$. The following are equivalent:

$$1. \sum_{j=1}^{n} x_j \otimes y_j = 0$$

2. for each
$$\phi \in X^*$$
 and $\psi \in Y^*$, $\sum_{j=1}^n \phi(x_j)\psi(y_j) = 0$

3. for each
$$\phi \in X^*$$
, $\sum_{j=1}^n \phi(x_j)y_j = 0$

4. for each
$$\psi \in Y^*$$
, $\sum_{j=1}^n \psi(y_j)x_j = 0$

Proof.

 $1. (1) \Longrightarrow (2):$

Suppose that $\sum_{j=1}^{n} x_j \otimes y_j = 0$. Let $\phi \in X^*$ and $\psi \in Y^*$. Then

$$\sum_{j=1}^{n} \phi(x_j)\psi(y_j) = \phi\left(\sum_{j=1}^{n} \psi(y_j)x_j\right)$$

2.

3.

Exercise D.4.0.7. Let X, Y be vector spaces. Then $(X \otimes Y, \otimes)$ is a tensor product of X and Y.

Proof. Let Z be a vector space and $\alpha \in L^2(X,Y;Z)$. Define $\phi: X \otimes Y \to Z$ by $\phi\left(\sum_{j=1}^n \lambda_j x_j \otimes y_j\right) := \sum_{j=1}^n \lambda_j \alpha(x_j,y_j)$.

• (well defined):

Let $u \in X \otimes Y$. Then there exist $(\lambda_j)_{j=1}^n \subset \mathbb{K}$, $(x_j)_{j=1}^n \subset X$, $(y_j)_{j=1}^n \subset Y$ such that $u = \sum_{j=1}^n \lambda_j x_j \otimes y_j$. Suppose that u = 0. Let $\phi \in Z^*$. Then $\phi \circ \alpha \in L^2(X,Y;Z)$.
